Valiuz — Deep Research Report

Prepared for: Head of Generative AI

Contents

1. Company at a glance

Valiuz is the data alliance and retail media sales house of the Association Familiale Mulliez, created in 2019 and headquartered in Lille with offices in Paris and across its operating markets. Member retailers contribute customer and transaction data into a shared pool, and Valiuz builds audience, measurement and advertising products on top of it.

The scale figures that circulate can now be reconciled, and the reconciliation is worth carrying into the room. The data alliance comprises 18 AFM banners — including Auchan, Chronodrive, Leroy Merlin, Decathlon, Kiabi, Boulanger, Electro Dépôt and Norauto — claiming 13% of French household consumption and 30 million unique active customers over twelve months. The retail media entity created by the merger adds seven Groupement Les Mousquetaires banners including Intermarché, Bricomarché and Bricorama, giving 25 retailers in total. That combined entity covers more than 10,000 points of sale — around 6,095 within the AFM and 4,361 within the Mousquetaires — across six countries: France, Belgium, Italy, Poland, Spain and Portugal. Different documents quote 16, 18 or 25 depending on whether they mean data-contributing banners or monetised retail media inventory, and the distinction is data alliance versus sales house rather than an unresolved contradiction.

The structural change is the dominant fact about this business right now. Discussions with the Mousquetaires began in January 2024 and produced first a purchasing alliance, Aura Retail, in September 2024. The retail media merger was announced on 7 and 8 September 2025, took effect commercially on 1 January 2026, and a reorganised governance was published on 19 January 2026. Infinity Advertising's 50 staff joined Valiuz's 310, and all 360 positions were retained. Bruno Delahaye is President with Sébastien Zecchini as chief executive; Alban Schleuniger, previously managing director of Infinity Advertising, leads French retail media business; Olivier Boutin leads offers, marketing and French customer engagement; Frédéric Marty-Debat leads global retail media development covering international and platform. Mathieu Dodergny is Chief Technical Officer.

Financially this is a company spending ahead of revenue by design. Revenue was €6.8 million in 2023 against an operating loss of €11.6 million, and €18.7 million in 2024 against losses of €21.9 million. Infinity Advertising ran €19.5 million of revenue in 2024 at roughly breakeven. A €50 million round closed in 2022, and a further €103 million was raised from the AFM in spring 2025 at a valuation of approximately €225 million, used to fund the Mousquetaires capital entry and to buy in retail media units from existing shareholders — iMediacenter from Auchan and Adeo Retail Media from the Leroy Merlin group.

Questions to ask on the day:

- Which of the scale figures does the business actually manage against internally — banners, profiles, or points of sale?
- Eight months after the merger, what is still running on two sets of systems?

- Does the 2026 GMV target depend on new banners joining, or on more spend from existing ones?

2. Strategic direction

Three strands are publicly stated and the leadership has been explicit about all three.

Opening the alliance beyond the Mulliez ecosystem. Zecchini said in May 2025 that the Intermarché project marked the beginning of Valiuz opening to retailers outside the AFM, and reported inbound partnership enquiries following the announcement. The stated international ambition at that point was twelve countries within three years, including Germany.

Building European scale against Amazon. The merger release positions the combined entity as an incontestable European retail media leader, with the commercial framing being unified inventory sold once across banners rather than banner by banner. Alban Schleuniger put the logic bluntly: it is impossible to fight Amazon alone. The GMV trajectory tracks it — €50 million in 2024, €100 million in 2025, and €200 million targeted for 2026, a doubling each year. The first post-merger results were reported in January 2026 as a 24% increase in new advertisers and roughly 90% growth in budgets positioned in advance across the three food banners, Auchan, Chronodrive and Intermarché, against 2025.

Competing on measurement credibility rather than reach alone. Valiuz obtained CESP eRetail Data Trust certification in June 2025 covering both on-site and off-site environments, and its Head of Insight and Measurement framed the ambition as standardising indicators to offer reliability assurance to other retailers. Valiuz Connect is the platform expression: it added Intermarché campaign measurement in February 2026 alongside Auchan and Chronodrive, with a stated roadmap to integrate all European Valiuz partners by 2027.

On AI specifically the public record is thin and internally focused. In October 2025 Valiuz announced a Google Cloud partnership to deploy Gemini Enterprise across the organisation, with Dodergny stating that nearly half the workforce already used AI and that the aim was to embed it throughout operations. The named use cases were omnichannel campaign optimisation, automated hyper-personalised content creation for retail media, and cross-tool collaboration and knowledge sharing. Separately, Valiuz publishes a Baromètre GEO measuring generative-AI-referred traffic to French e-commerce sites, now in its second edition — a research product rather than a commercial one. The public evidence therefore points to an internal-productivity-first position, with AI-generated retail media creative named as an intention rather than announced as a shipped product.

Questions to ask on the day:

- Is generative AI framed internally as a productivity programme, a product roadmap, or both, and who owns each?
- What does opening to other retailers require technically that pooling Mulliez banners did not?
- Does the 2027 European measurement roadmap assume one platform or federation across national platforms?

3. Industry forces

Growth is real but decelerating, and Europe decelerates faster. French retail media reached €1.38 billion in 2025, up 13%, making it 11% of a €12.4 billion digital advertising market and the second most dynamic lever after social. In the first half of 2026 it reached €775 million, up 18%, in a total digital market of €6.69 billion up 12%. Oliver Wyman forecasts around 11% for the full year with a slower second half, taking the French market to roughly €13.9 billion. Against that, WARC has forecast global retail media growth falling into single digits excluding Amazon, its lowest recorded rate, with European growth expected to slow to single digits — so the French figures and the global outlook point in different directions and the honest position is a range rather than a point.

The growth is in search, not display. In 2025 French retail search reached €1.2 billion, up 17%, while retail display managed €340 million, up 3% — search is close to four-fifths of the category. This matters more than it is usually discussed. Display is the part that requires identity infrastructure, audience segments and clean rooms, which is what a data alliance is built to serve, and it is growing at roughly the rate of the wider ad market. The part that is compounding is the part closest to being disintermediated by AI-assisted discovery.

Valiuz owns the best French dataset on that discovery shift, and its own findings are more nuanced than the threat framing suggests. The first Baromètre GEO, published 4 February 2026, found AI-referred traffic to the e-commerce sites of thirteen French retailers multiplied by eighteen between December 2024 and December 2025, with 72% of AI-referred visits coming from new visitors against 61% for non-AI traffic. The second edition, published July 2026 and covering more than two million visits between May 2025 and May 2026 across the same thirteen retailers, found the multiple had reached twenty over twelve months and that LLM-referred traffic converts at 1.8% against 1.5% for other channels — roughly 20% better. Adobe's US series is directionally identical. So AI referral is currently a smaller, newer, better-converting channel rather than a straightforward erosion. The strategic question is what happens as volume scales: an arrival that lands directly on a product page bypasses the retailer's search results page, and the search results page is where four-fifths of French retail media revenue is made.

Amandine Launois, Valiuz's Head of Data and Insights Retailer, has drawn the sharper conclusion publicly: that generative AI will affect consumption more than the internet did, and that with agentic deployment consumer loyalty may shift from the brand to the agent.

Consolidation is the structural response to Amazon, which holds more than two-thirds of retail media spend across the five largest European markets. Every major European move of the last two years reads as pooling against that: Valiuz with the Mousquetaires; Carrefour and Publicis's Unlimitail reaching 21 countries and 35 retailers; dunnhumby's Network Alliance launched in June 2026 with Tesco, B&Q, John Lewis and Waitrose; and Edeka consolidating its in-store vendors.

Measurement fragmentation is the named barrier and it costs money. Around 70% of buyers cite the lack of retail media standards as a barrier to investment, and while 88% require return-on-ad-spend data only 71% of networks provide it consistently. IAB Europe's Commerce Media Measurement Standards V2 landed in January 2026 with a July 2026 compliance deadline, and in France the CESP eRetail Data Trust certification standardises eight campaign indicators including incremental ROAS.

Cost structure is inflating from the AI side while market price falls. Gartner forecasts AI-optimised infrastructure spending growing sharply in 2026 with inference overtaking training for the first time, noting that agentic AI amplifies compute intensity through multi-step autonomous execution. Meanwhile Amazon made its clean room free to all Sponsored Ads advertisers in September 2025. Criteo is the visible casualty: second-quarter 2026 retail media revenue down 21% with full-year guidance cut, the disclosed cause being large retailers moving from managed service to self-service.

Questions to ask on the day:

- Does the deceleration in European retail media growth show up in the 2026 plan yet, or is it a 2027 conversation?
- Your own barometer says AI traffic converts better. Internally, is GEO a threat to search inventory, a new inventory type, or a measurement product?
- Where does compute cost sit in the P&L conversation now that AI adoption is a stated priority?

4. Regulatory and compliance frame

GDPR as enforced by the CNIL is the operative constraint on this business model, and there is now a precedent written almost exactly for it. On 30 December 2025 the CNIL fined a company €3.5 million under deliberation SAN-2025-017 for transmitting loyalty programme members' email addresses and phone numbers to a social network for advertising targeting since February 2018. The company operated both physical stores and an online shop, with a loyalty programme of around 10.5 million members in France plus members in Belgium, Luxembourg and other EU countries; the deliberation refers to data on more than 10.8 million members. The social network matched the transmitted data against its own users both to identify members and to build lookalike audiences. The CNIL found the targeting had no valid legal basis, because the loyalty sign-up form said nothing about transmission for advertising and consent could therefore not be informed, alongside transparency, security and cookie findings — the security breach concerning an inadequate password policy, which the company remedied during proceedings. Sixteen other European authorities participated. The decision was made public on 22 January 2026, and the CNIL chose deliberately not to name the company, on the grounds that targeted social advertising is a widespread practice and the public interest lay in the rule rather than the identity.

The rule established is the one that matters here: loyalty enrolment consent does not carry over to advertising activation, and a separate, explicit, clearly labelled opt-in is required. The sanctioned mechanic is precisely the mechanic of off-site retail media.

Two further constraints sit alongside it. The Court of Justice's Schrems v Meta ruling held that storing personal data indefinitely for targeted advertising, and using indiscriminately all data held, is disproportionate — so retention caps and per-purpose data subsets need to be defensible. And the CNIL's own reference framework for commercial activity management expressly excludes profiling from third-party sources, meaning there is no CNIL framework blessing pooled retail data. The most consequential item on the horizon is that the CNIL's 2026 work programme explicitly plans guidance on cross-domain consent, clarifying single consent mechanisms across multiple websites and brands within groups, plus AI supply-chain responsibilities. That guidance is written for exactly this business model and is expected during 2026.

ePrivacy still governs anything touching a device. The ePrivacy Regulation proposal was withdrawn in February 2025 for lack of consensus, leaving the 2002 Directive and its French transposition fully in force, and EDPB guidelines finalised in October 2024 bring tracking pixels, URL decoration, IP-only tracking and server-side identifiers within the consent requirement — so server-side tracking and hashed-email onboarding are not a consent workaround. Cookie enforcement remains the CNIL's most active line.

The AI Act is lighter than commonly assumed for this business. The Digital Omnibus on AI, Regulation (EU) 2026/1744, entered into force on 27 July 2026, deferring Annex III high-risk obligations to 2 December 2027 and Annex I to 2 August 2028. Advertising, marketing, audience targeting and consumer profiling appear in none of Annex III's high-risk categories. For an organisation deploying general-purpose models rather than developing them, the live obligations are narrow: AI literacy duties, the prohibited-practices regime, and Article 50 transparency from 2 August 2026 covering deepfake disclosure and emotion-recognition notification.

Two escalation paths matter. Putting the company's own brand on a high-risk system, or substantially modifying one, makes it a provider with the full obligation stack — a white-labelled generative creative or audience tool sold under the alliance's brand is the classic trigger. And any feature touching creditworthiness or insurance pricing falls into Annex III, as does internal HR and recruitment AI, where the CNIL has made recruitment a 2026 control priority. On prohibited practices, the Commission's guidelines state that personalising ads on user preferences is not inherently manipulative, but flag as prohibited the targeting of low-income residents with predatory financial products and of older individuals with deceptive personalised offers — so socio-economic segments used to target credit or high-cost products are the specific pattern to watch, live since February 2025 at the highest fine tier.

The DSA and DMA reach this business through its partners rather than directly. The alliance is probably not itself an online platform, but its retailer partners' marketplaces generally are, and the alliance's segments are the input to their compliance: no segment constituting or proxying special-category data may be used for ads on a partner surface, minor-flagged audiences must be excluded from profiling-based targeting, and targeting-parameter disclosure must be exportable from segment metadata. On the other side, the DMA gives advertisers and publishers rights against gatekeepers, including pricing information and free access to measurement tools for independent verification — rights this business can invoke rather than only obligations it bears.

Two structural questions remain open. Loi Sapin requires sellers of digital advertising space to report to the advertiser within one month of broadcast covering services, prices, delivery quality and brand safety, with intermediaries acting under written mandate and remunerated only by the advertiser. No published opinion, administrative guidance or court decision addresses whether and how it applies specifically to retail media, or whether trade budgets negotiated as commercial cooperation can be recharacterised as media buying. This is the highest-value open legal question in the frame and needs French counsel. Separately, under the Data Governance Act, Arcep is France's competent authority for data intermediation services and the neutrality test requires that intermediated data not be used for the intermediary's own purposes — so a pooled alliance monetising the pooled data for its own products almost certainly falls outside the intermediation regime, meaning it has no safe harbour there and stands or falls on GDPR alone.

Questions to ask on the day:

- After the December 2025 loyalty decision, has consent architecture at enrolment been reworked across member banners, or is that still in flight?
- Who inside the organisation answers "is this AI use case allowed?", and how long does that answer take?
- Is the CNIL cross-domain consent guidance expected this year being tracked as a planning input?

5. The generative AI leader's world at Valiuz

This section rests on role research across comparable postings and surveys of AI leaders. One caveat up front: there is no dense publicly indexable corpus of Head of Generative AI postings in European retail or adtech, so the accountabilities are well evidenced while the named metrics come more from surveys of practice than from posting text.

Six accountability clusters recur across every credible source: a portfolio of use cases prioritised against measurable business impact; platform and tooling, meaning the model gateway, evaluation harness and its cost management; enablement and adoption, meaning training, champion networks and change management; governance and AI risk; vendor and model relationships; and talent. Enablement is the single largest block by posting word count.

The most useful finding on measurement is negative: postings almost never name a KPI, they name the obligation to invent one. A representative example requires the hire to define KPIs for adoption, maturity, impact and user satisfaction with regular reporting to executive leadership — four families, zero numbers. The metrics that do exist come from surveys: around 72% of leaders track structured business-linked return metrics, but only 39% report enterprise-level EBIT impact and most attribute under 5% of EBIT to AI; only a quarter have moved 40% or more of pilots into production; and companies plan roughly 1.7% of revenue on AI in 2026. Gartner's blunt version of the accountability is that 75% of chief data and analytics officers not seen as essential to AI success will lose their C-level position by 2027.

No survey measures time allocation for this role directly, which is itself a gap. Reconstructing from priority rankings and posting weightings puts enablement and change management first; governance and review second, now the leading data-and-analytics priority for 2026 and made materially heavier by 63% of organisations requiring human validation of AI outputs, up from 22% a year earlier; use-case triage third; executive stakeholder management and business-case defence fourth; and vendor and model evaluation fifth.

The documented frustrations are consistent. Difficulty scaling is the top-cited barrier to return at 65%, up from 33% the previous quarter, and the share of businesses scrapping most AI initiatives rose to 42% from 17% year on year, with 46% of proofs of concept abandoned before production. Data readiness is the named cause: 57% of data leaders identify data reliability as the key obstacle preventing pilots reaching production, and 76% say their AI governance does not keep pace with employee use. Model churn has become a real switching cost, with a growing share of enterprises running five or more models in production and a documented shift away from casual model-swapping because changing one part of a workflow affects all downstream dependencies. Adoption is uneven by design: no more than 10% of organisations are scaling agents in any individual business function despite widespread experimentation, and coding takes the majority of departmental AI spend against a single-digit share for marketing.

One statistic to handle with care: the widely quoted claim that 95% of generative AI pilots fail is a claim about measurable P&L return rather than technical failure, its methodology is reported inconsistently, and its derivation has been questioned by academics who could not locate it in the source document. If a number is needed in the room, the 42%, 39% and 25% figures above are methodologically transparent and point the same way.

Questions to ask on the day:

- What does success look like in twelve months, in a form that could be shown to the board?
- Which is the harder constraint right now — data readiness, legal clearance, or people's willingness to change how they work?
- Where is the biggest gap between AI adoption in one team and another?

6. Peer signals

Unlimitail, the Carrefour and Publicis venture, launched a Creative Studio in early 2026 that is explicitly generative, producing ad creative at scale across on-site, off-site and in-store while holding brand compliance; one beverage campaign generated roughly 1,100 personalised creative variations and over 900 off-site formats within 48 hours. It chose Snowflake data clean rooms in June 2026 to power a global retail media data hub, with its chief executive framing data sovereignty as what brings retailers in, and partnered with NIQ for cross-retailer incrementality measurement across 21 countries and 35 retailers.

dunnhumby and Tesco Media launched a Creative Studio at the Tesco Media Upfront in October 2025 — a generative tool automatically producing compliant ads across formats for on-site and off-site — and eight months later, in June 2026, launched the Network Alliance with Tesco, B&Q, John Lewis and Waitrose, letting brands activate across retailers through a single route with shared standards. This is the closest structural analogue to Valiuz: a multi-retailer data business shipping a generative creative product and a cross-retailer measurement standard inside the same twelve months.

Criteo has rebuilt its roadmap around agentic commerce, positioning itself as the data layer between retail inventory and LLM assistants. It launched an agentic commerce recommendation service via its MCP server in February 2026, was named an early ad tech partner in OpenAI's ChatGPT ads pilot, and ran a fully MCP-orchestrated campaign with dentsu in France in May 2026 where an agent takes natural-language instructions and executes across the ecosystem without manual platform use. No performance metrics were disclosed for that campaign.

LiveRamp repositioned its data collaboration network as AI infrastructure across three moves in six months — marketplace expansion to data, models and agents, agentic upgrades including audience-building and measurement agents, and NVIDIA infrastructure integration. The framing is notable: its chief product officer sells agentic capability on a governance argument, within the governed environment customers already trust, rather than on a capability argument.

Adeo is the most instructive case in the set because it is a Valiuz member banner and has published its operating model rather than just its products. Its group technology leadership runs weekly cross-country progress reviews against a mapping of all use cases that is updated and shared, prioritised on economic value, customer benefit or employee impact. It deployed a

Kong-based LLM gateway handling governance, cost management, security, traceability and model evaluation, with a stated position of not hosting its own models near-term because the technology moves too quickly. Named outcomes include a large rise in product data enrichment completion and generative description work across a catalogue running to millions of references, alongside a group-wide AI training programme.

Ahold Delhaize appointed a Chief Data and Artificial Intelligence Officer in May 2026 reporting to the CIO — the clearest public AI-org-structure signal in the peer set, placing the AI leader under the CIO rather than the chief executive or chief marketing officer.

No named Head of Generative AI or equivalent could be found at Criteo, LiveRamp, dunnhumby or Unlimitail. Product leadership is public; a dedicated generative AI org leader is not. That absence is itself a datapoint about how new the role is.

Questions to ask on the day:

- Adeo is a member banner and has published its AI operating model. How much of that travels across the alliance?
- Unlimitail and Tesco Media both shipped generative creative products in the last year. Is that the competitive benchmark being tracked?
- Does Criteo's agentic commerce positioning read as a threat, a template, or neither?

7. Friction map

Every new AI use case needs a fresh answer to whether the data can be used that way, and the reasoning from the last time lives in someone's inbox. When legal or the data protection officer asks for the evidence behind a use case, assembling it takes days of chasing across teams. Regulatory change arrives faster than the internal reading of it, so the same instrument gets interpreted three times by three people.

Nobody can quickly answer whether something has already been tried, across 360 people in six countries and two merged organisations. The same business question returns different numbers depending on which member banner's data answers it, and measurement definitions get reconciled by hand for each new advertiser conversation.

Adoption is reported as seats and logins rather than as anything that changed in the work. Pilots stall at the boundary between a working demo and a production data contract with a member retailer. Advertiser and retailer questions arrive bespoke, and analysts rebuild near-identical answers repeatedly.

Model and vendor changes force previously finished work to be redone and re-evaluated. Teams use AI tools the sanctioned platform does not cover, and nobody has the full picture of what is in use. And value claims for AI cannot be cleanly separated from everything else that changed at the same time — which, in a year that included a merger, a new member group and a new governance structure, is a great deal.

Questions to ask on the day:

- Which of these recur every month rather than only during major programmes?
- Which creates the most manual checking and chasing?
- Which is visible to member banners or advertisers first?

Challenge cards

Card 1 of 2

Title: Proving a use case is allowed

The challenge: Every time a new AI use case is put in front of member data, the case that it is permitted has to be reassembled. The reasoning exists — someone worked out something similar six months ago — but it sits across legal reviews, impact assessment drafts, member contracts and email threads, and gets rebuilt rather than retrieved. By the time the answer arrives, the question has changed.

Who feels it: The Head of Generative AI most directly. Also the data protection officer and legal team fielding the same questions repeatedly, the data teams waiting to build, and the member retailers' own privacy functions who have to countersign.

Why it persists: The evidence needed to clear a use case is generated as a byproduct of separate processes — contracting, impact assessment, security review, member negotiation — and is never assembled into anything reusable, because no single team owns the assembled view. And the ground moves: the CNIL's cross-domain consent guidance is expected during 2026, AI Act transparency duties began on 2 August 2026, and the December 2025 loyalty decision reset what informed consent means at enrolment. Any assembled answer has a short shelf life, which discourages assembling one at all.

What solved looks like: A new use case gets a defensible provisional answer in an afternoon rather than a fortnight, because the last twenty answers and the reasoning behind them are findable. Legal spends its time on genuinely novel questions instead of re-deriving positions it has already taken.

Evidence base: CNIL deliberation SAN-2025-017 of 30 December 2025, made public 22 January 2026: €3.5 million for transmitting loyalty identifiers to a social network without valid consent, with findings including the absence of an impact assessment, across a loyalty base of around 10.5 million French members and with sixteen other European authorities participating. The CNIL's 2026 work programme planning cross-domain consent guidance. AI Act Article 50 transparency duties applying from 2 August 2026 under Regulation (EU) 2026/1744. The CNIL's commercial-activity framework expressly excluding third-party-sourced profiling, so no safe harbour exists. Survey evidence that 63% of organisations now require human validation of AI outputs, up from 22% a year earlier, and that 76% of data leaders say governance does not keep pace with employee AI use.

Open question: When you want to clear a new AI use case against member data, where does the answer actually come from today, and how long does it take?

Card 2 of 2

Title: Nobody knows what has already been tried

The challenge: People are building with AI across six countries and more than twenty banners, and there is no current picture of what exists, what worked, what was abandoned and why. When a member retailer asks whether something has been solved, or an executive asks what to fund next, the answer comes from going and asking people.

Who feels it: The Head of Generative AI, who owns the portfolio view and has to defend it upward. Also the country and banner teams who cannot see each other's work, and the executives asking for a prioritised list that is current rather than three months old.

Why it persists: The organisation changed shape in eight months — a merger effective 1 January 2026, a new member group, a new governance structure published 19 January — and the seams between the merged entities run straight through where a shared record would need to live. The incentive is also asymmetric: building something is visible and rewarded, writing down what was tried and abandoned is neither, so the record of failures, which is the more valuable half, never gets made.

What solved looks like: Before a team starts building, they can see in minutes whether someone in another country already tried it and what happened. The quarterly prioritisation conversation starts from a current list rather than from three weeks of asking around.

Evidence base: Valiuz and Infinity merged operationally on 1 January 2026 with 360 staff across six countries, with reorganised governance published 19 January 2026. Adeo, a Valiuz member banner, runs weekly cross-country progress reviews against a mapping of all use cases that is updated and shared — direct evidence that a comparable French retail group found this problem worth solving structurally. Survey evidence that 65% of leaders cite difficulty scaling use cases as a barrier to return, up from 33% the previous quarter; that 42% of businesses scrapped most AI initiatives with 46% of proofs of concept abandoned before production; and that no more than 10% of organisations are scaling agents in any single function despite widespread experimentation. Valiuz's own chief technical officer stated in October 2025 that roughly half the workforce was already using AI.

Open question: If someone asked you today for the current list of AI use cases across all countries and banners, with their status, how would you produce it?

Where this document is thin

- No public statement of Valiuz's commercial generative AI roadmap exists, as distinct from the internal Gemini Enterprise adoption programme. The only AI-adjacent public output is the Baromètre GEO, which is research.
- No named Head of Generative AI or equivalent is public at Valiuz, or at Criteo, LiveRamp, dunnhumby or Unlimitail.
- Valiuz financials for 2025 or 2026 are not available; the most recent verified figures are FY2024, and they predate the merger.
- No authoritative source establishes whether loi Sapin applies to retail media inventory sales and trade budgets. No published opinion, administrative guidance or court decision could be found. This is the largest open legal question.
- No loyalty-data guidance or enforcement from the Spanish, Polish or Belgian authorities was found, despite Valiuz operating in all three.
- The company sanctioned in CNIL deliberation SAN-2025-017 was deliberately not named by the regulator, so its relationship, if any, to the Valiuz alliance cannot be established from public sources.
- No credible, methodologically transparent data exists on French AI and data-engineering talent cost or scarcity; recruitment-agency content dominates the search space.
- No survey measures time allocation for the Head of Generative AI role; section 5's account is reconstruction.
- No figure exists for AI-referred traffic as a share of total French e-commerce traffic. Valiuz's own barometer publishes growth multiples, conversion rates and visitor behaviour, not absolute share.
- Adeo's published product-data enrichment outcome is reported at different completion figures across sources and should be quoted from the primary interview rather than secondary coverage.

- Whether in-store digital screens fall within any French advertising carbon reference framework could not be established, which is a live methodological gap given how fast that inventory is being built.
