Challenge cards

Where this document is thin

1. Company at a glance

Myriade is a Lille-based enterprise software company selling an AI-native data intelligence platform. The company was incorporated in April 2025, but the product predates it: the founder has stated publicly that the first commit dates from January 2023, so what looks like a one-year-old business is closer to a three-year build with a one-year commercial history. Several unrelated French businesses share the Myriade name, which is worth keeping in mind when checking anything.

Benjamin Derville is founder and chief executive. His background is engineering rather than pure commerce — an engineering degree from the Université de Technologie de Troyes — with prior roles at Norauto International, Norauto France, Fluximmo and Vroomly. Public records also identify David Alinat as co-founder covering marketing, so this is not a solo-founder company, and third-party business databases put current headcount at around twelve. Public headcount signals of this kind are directional rather than audited.

The founder's background matters commercially. Norauto and Vroomly are both Mobivia companies within the Mulliez network, and Myriade's publicly referenced customers cluster in the same orbit — Jules, Promod, Recommerce, Vroomly, Dickson, Ekip and Le Plein. That is a warm-network go-to-market, which is a genuine advantage in the first year and a genuine question in the second.

The commercial claims are now company-stated rather than inferred from third-party reporting. In a May 2026 release marking its first year, Myriade said it had won around a dozen large accounts including Jules, Promod and Recommerce, that those customers generate more than 3,500 analyses a month, that their data teams recover on average one to two days of work a week, and that the platform helps reduce data infrastructure costs by 27% to 40% on average. It also states that it connects directly to raw enterprise warehouses and produces a documented, reliable intelligence layer in under 72 hours, where competitors require months of manual preparation, with no retention of or training on customer data.

The technology position is warehouse-agnostic, with publicly named integrations including Snowflake, BigQuery, Databricks, Redshift, PostgreSQL and MySQL. Pricing has been described publicly as a SaaS subscription billed per active user and by query volume. Security posture as publicly described includes read-only mode, limited data preview, no data retention by partners, and zero-knowledge encryption for sensitive data described as forthcoming.

The company said in May 2026 that it planned to recruit two to three people by the end of 2026 to accelerate French market development.

Questions to ask on the day:

- Where does Myriade now win most decisively: making data usable, making AI reliable on enterprise data, or reducing data-team workload?

- Which customer segment has shown the strongest repeatability — sector, company size, data maturity, or use case?
- How much of the first year's pipeline came through the founding network, and what does the second year look like without it?

2. Strategic direction

The public thesis is direct: AI does not work on badly organised data, and Myriade's job is to organise and govern the warehouse so that both humans and AI can trust it. The stated sequence is staged — boost the data team first, establish governed and reliable data next, then open self-service access to the wider organisation. That sequencing is a commercial choice as much as a technical one, because it means the first buyer is the data team and the eventual value is claimed elsewhere in the business.

The product narrative has broadened materially in a year. Material from July 2025 framed Myriade as an assistant letting users chat with their data; by 2026 the company describes an AI-native platform for data intelligence built around a managed context layer, documentation, quality controls and governance. That is a move from a feature-level natural-language interface toward a data-intelligence control layer, and it changes who the buyer is and what the competition looks like.

In May 2026 Derville argued publicly that the context layer is the strategic asset in the AI era, because it is what separates a useful agent from a confidently wrong one, and emphasised portability and customer ownership of that context. The company's sovereignty framing follows the same logic: the platform installs at the client, the intelligence layer belongs to the client and remains exportable at any time. In a market where the alternatives are largely American platform vendors, and in a French buying environment increasingly attentive to that, this is positioned as a commercial argument rather than only a technical one.

In April 2026 Derville also described Myriade's internal AI development approach as intent, then transformation, then proofs — with human review moving from reading every line of generated code toward auditing evidence that the result worked. That is worth noting because it is the same argument the product makes to customers, applied internally: trust the evidence, not the demonstration.

Questions to ask on the day:

- Which part of the public thesis is the non-negotiable core, and which parts are packaging around it?
- What is the strongest evidence customers value the context and governance layer rather than only the conversational interface?

- Does the sovereignty and portability argument actually close deals, or does it mainly remove objections?

3. Industry forces

AI has moved into the analytics workflow rather than sitting alongside it. dbt Labs reported in April 2026 that 72% of surveyed data professionals prioritised AI-assisted coding and 77% of leaders were pushing teams to improve productivity with AI. The pressure has shifted from experimentation to embedded practice.

Trust is now the binding constraint. The same research found trust in data and data teams rising from 66% to 83% as an organisational priority, with 71% concerned about incorrect or hallucinated outputs reaching stakeholders. That is the market Myriade is selling into, and it is a favourable one — but it also means every buyer is primed to interrogate reliability claims rather than accept them.

Infrastructure cost is a live purchasing consideration rather than a background concern, with cloud spend management repeatedly reported as a top organisational challenge against continued double-digit spend growth. Myriade's claim of 27% to 40% infrastructure cost reduction speaks directly to that, and is arguably an easier sale than analytics quality because it is measurable in an existing budget line.

The large platforms are absorbing conversational analytics into the data platform itself. Snowflake offers Cortex Analyst as a managed conversational service over structured data; Databricks positions Genie as a natural-language experience grounded in governed organisational data through Unity Catalog; ThoughtSpot sells Spotter as an AI analyst built around semantic models, traceability and governance rather than raw text-to-SQL. The scale asymmetry is stark: Databricks reported in August 2026 growth above 80% year on year, annualised revenue above \$7 billion, and continued investment in Genie and its AI gateway.

That asymmetry defines the strategic question. If conversational querying becomes a free feature of the warehouse a customer already pays for, then differentiation has to live in warehouse-agnosticism, context ownership and portability, workflow depth, speed to value, or enterprise fit — which is, to be fair, precisely where Myriade has positioned itself.

Talent is moving upward from execution toward system design, with AI reshaping rather than replacing data roles and the work shifting from writing code toward building systems that support reliable agentic workflows. That supports the buyer proposition of returning one to two days a week to data teams, provided the recovered time visibly goes somewhere valuable.

Questions to ask on the day:

- Which of these forces is changing customer buying behaviour fastest?

- Where is the most dangerous commoditisation risk — natural-language querying, data quality, semantic modelling, or agent orchestration?
- How often does a deal come down to warehouse-agnosticism, and how often to something else entirely?

4. Regulatory and compliance frame

For a company of this size the regulatory frame matters less as a compliance burden than as a component of enterprise sales, and the practical question is what a customer's procurement and security functions will demand.

GDPR applies whenever personal data is processed. The provisions that bite are the controller and processor obligations: appropriate technical and organisational measures, sufficient guarantees from the processor, and processing governed by contract with documented instructions. For Myriade the allocation of controller and processor roles across a platform that installs at the client is worth having settled in writing rather than assumed, because it determines who answers what when a customer's data protection officer asks.

The AI Act timetable moved in Myriade's favour and it is worth knowing precisely. The Digital Omnibus on AI, Regulation (EU) 2026/1744, entered into force on 27 July 2026 and deferred high-risk obligations for stand-alone Annex III systems from 2 August 2026 to 2 December 2027, and for AI embedded in Annex I regulated products to 2 August 2028. What applied from 2 August 2026 is the Article 50 transparency regime, alongside prohibited practices in force since February 2025, the AI literacy duty, and general-purpose AI provider obligations applying since August 2025. Analytics over enterprise data does not sit in the Annex III high-risk categories, so a deployer of general-purpose models in this category carries narrow live obligations. The escalation path to watch is putting your own brand on a high-risk system or substantially modifying one, which makes you a provider with the full obligation stack.

The EU Data Act has applied since 12 September 2025 and includes provisions on fairer data access and on cloud switching and interoperability. Whether and how those apply depends on whether the service falls within the defined data-processing service categories — but the direction is congruent with Myriade's portability argument, which is a rare instance of regulation moving toward a vendor's existing position rather than against it.

NIS2 applies to covered entities in specified sectors including cloud and managed service providers, with scope depending on activity, size and national implementation. France had still not promulgated its transposition law by August 2026, and the Commission referred France to the Court of Justice in July 2026 over the delay. The practical consequence for a small vendor is that NIS2 arrives through customer contracts rather than direct regulation — supplier security questionnaires, certification evidence, incident notification clauses and sub-supplier disclosure —

with no grace period tied to transposition.

CNIL guidance on AI systems using personal data emphasises purpose definition, data minimisation, data quality, output controls, monitoring for drift, and understanding system limitations and possible harms.

The realistic reading is that the compliance conversation is not about a single AI law. It is a stack of customer-assurance requirements — lawful processing, tenant separation, access control, auditability, model and provider governance, data residency and contractual accountability — arriving repeatedly and in different formats from each enterprise buyer.

Questions to ask on the day:

- Which compliance requirements most often delay or weaken a deal today?
- Where do customers ask for guarantees that are hard for a company of this size to provide quickly?
- Has portability become a differentiator in enterprise negotiations, or is it still mainly a positioning argument?

5. The founder-CEO's world at Myriade

At around twelve people with roughly a dozen enterprise accounts, the founder-CEO remit is not the textbook one. Strategy, capital allocation, senior hiring, major customer relationships and external narrative are all nominally in scope, but at this stage the founder is also the primary seller of the product and vision, and customer development, recruiting, product work and operations compete for the same calendar.

Four control points define the role here: choosing the product problem, winning and learning from customers, hiring and aligning a small team, and protecting cash and strategic optionality. Two of those are under visible pressure. The company has stated an intention to hire only two to three people by the end of 2026 while selling into large enterprises with heavyweight procurement — which means the founder's own time is the scaling constraint, not headcount budget. And the enterprise buyers Myriade has won are exactly the buyers who generate the most assurance work per euro of contract value.

Myriade's public material makes a specific promise about founder involvement: direct access to the founding team is listed as a customer-facing benefit alongside fast onboarding, automated documentation and quality controls. That is a real differentiator against platform vendors and simultaneously the thing that does not scale. It is worth being explicit that this is a deliberate trade rather than an accident.

The characteristic frustration in this role is not one hard decision but repeated context-switching — a customer asks for evidence, a prospect needs a proof point, the product needs prioritisation, a security questionnaire arrives, and the narrative still has to be maintained for the team and the market. The highest-value repeated workflows are therefore the ones that compress evidence gathering: understanding customer reality, comparing opportunities, checking claims, answering enterprise diligence and turning scattered inputs into a decision-ready view.

Questions to ask on the day:

- What recurring work most often pulls you away from the three things only you can do?
- Which information do you repeatedly have to reconstruct before making a decision or answering a customer?
- Direct founder access is a stated customer promise. What happens to it at thirty accounts?

6. Peer signals

Snowflake positions Cortex Analyst as a managed conversational service over structured data, with natural-language questions, REST APIs and the platform's own security and governance controls. Databricks positions Genie as a natural-language interface grounded in organisational data and governed through Unity Catalog, with Genie Agents letting data teams configure trusted data, metrics and business rules. Both are features of platforms customers already buy, which is the structural competitive fact.

The scale gap is worth stating plainly rather than dancing around. Databricks reported in August 2026 year-on-year growth above 80% and annualised revenue above \$7 billion, while continuing to invest in Genie and an AI gateway. No product-level comparison changes that asymmetry; what changes it is being agnostic across warehouses that these vendors are not, and owning a context layer the customer can take with them.

ThoughtSpot is the closest positioning analogue, having built Spotter around semantic models, human feedback, traceability and enterprise governance rather than text-to-SQL alone — which is the same argument Myriade makes, from a much larger installed base.

dbt Labs is repositioning around AI-ready structured data and agentic workflows, emphasising context and trust while continuing to serve analytics-engineering teams. It is both a potential partner in the stack and a claimant on the same conceptual territory.

Myriade's own May 2026 openness benchmark makes context portability the competitive frame and compares Myriade with Nao on exportability and ownership of the context layer. The company itself labels some of those comparisons self-assessed pending documentation, which is honest and also a gap a competitor could exploit.

The consistent signal across the set is that the market has moved from asking a database a question toward governed, context-rich, agentic analytics. Differentiation has to live in reliability, context ownership, workflow depth, enterprise fit or speed to value rather than in the chat interface.

Questions to ask on the day:

- Which competitor or adjacent platform most forces you to sharpen the proposition?
- Where are the platform leaders structurally weakest, and is that weakness durable?
- What would a peer have to ship for you to consider the category commoditised?

7. Friction map

Customer evidence is scattered by nature. Facts about accounts live across calls, tickets, demos, emails and notes, so building a clean company view means reconstructing it, and the same enterprise question gets answered differently depending on who is asked. At around twelve people with a dozen enterprise accounts, most of that context sits with the founder, which makes the founder a hidden information bottleneck rather than only a decision-maker.

Enterprise assurance is a repeating tax. Security, privacy and procurement questionnaires require senior people to retrieve evidence that already exists somewhere, in a slightly different form each time. The specific claims Myriade makes publicly — installation at the client, no retention or training on customer data, read-only access, exportable context, zero-knowledge encryption as forthcoming — are each individually the kind of statement a buyer will want evidenced, and there is no public technical documentation independently validating them.

Product signal arrives as anecdote. Feedback comes through sales calls, demos, customer sessions and internal conversation, making it hard to separate a recurring need from a loud one-off. In a company with a dozen accounts the sample is small enough that one insistent customer can look like a pattern, and customer-specific work can quietly become product work before the repeatable shape is clear.

Proof lags product. The public story and the shipped capability can drift apart when the platform changes faster than the sales evidence supporting it, and the openness benchmark being partly self-assessed is a live instance of that.

Breadth and sharpness pull against each other. The company has to show enough platform breadth for enterprise buyers while keeping a crisp reason to buy, and documentation and governance have to stay ahead of feature velocity or the trust argument undermines itself. As AI moves from analysis toward more consequential enterprise workflows, the cost of being wrong rises — which is favourable to the positioning and unforgiving of any gap between it and the reality.

Questions to ask on the day:

- Which of these is visible every week rather than every quarter?
- Where does information most often get lost between customer conversation, product decision and execution?

Challenge cards

Card 1 of 2

Title: Proving the seventy-two hours

The challenge: The central commercial claim is that Myriade connects to a raw warehouse and produces a documented, reliable intelligence layer in under 72 hours, where alternatives need months of manual preparation. Every serious enterprise prospect wants that demonstrated on their own data, and each demonstration is bespoke — a new warehouse, a new schema, new naming conventions, new gaps.

Who feels it: The founder and CEO, because at this size he is the primary seller and the technical credibility in the room. Also engineering, pulled into pre-sales; the prospect's data team, who must grant access before anything can be proven; and the customer's security function, who must clear that access first.

Why it persists: The claim is differentiating precisely because it is hard to believe, so it cannot be asserted — it has to be shown. But showing it requires the access that the enterprise assurance process gates, which means the fastest part of the product sits behind the slowest part of the sale. The better the claim performs, the more prospects want it proven.

What solved looks like: The proof runs from a standard starting position rather than being reassembled per prospect, the access needed to run it is cleared by an assurance pack that already exists, and what was learned from the last dozen warehouses makes the next one faster rather than starting from zero.

Evidence base: Myriade's May 2026 first-year release states connection directly to raw enterprise warehouses producing a documented, reliable intelligence layer in under 72 hours, against competitors requiring months of manual preparation, with no retention of or training on customer data. It reports around a dozen large accounts generating more than 3,500 analyses a month, data teams recovering one to two days a week, and infrastructure cost reductions of 27% to 40%. Publicly named integrations span Snowflake, BigQuery, Databricks, Redshift, PostgreSQL and MySQL — six distinct starting positions.

Open question: For the last five prospects, how much elapsed time sat between first contact and being able to run against their data, and what was the gating step?

Card 2 of 2

Title: Answering enterprise diligence repeatedly

The challenge: Answers on security, privacy, data handling, architecture, product limits and evidence have to be assembled for each customer. The work is rarely new, the source material is spread across different places, and each buyer asks for it in a slightly different form.

Who feels it: The founder and CEO, since on a team of roughly twelve the assurance file is his desk. Also engineering, asked to confirm technical statements; and the customer's own procurement and security functions, re-verifying claims that another buyer has already cleared.

Why it persists: Enterprise questions cut across functions while a small team has limited capacity to maintain a continuously trusted evidence base, and the facts move as the product, model providers and regulatory expectations change. NIS2 supplier-security duties reach small vendors through client contracts regardless of France's transposition delay, and GDPR processor obligations require documented arrangements rather than assurances. Several of Myriade's differentiating claims are the kind buyers evidence rather than accept, and the company's own openness benchmark is labelled self-assessed pending documentation.

What solved looks like: A customer question is answered confidently without the founder becoming the research coordinator, and the team spends its time on what is genuinely new rather than reassembling what it already knows. The claims that differentiate the product are documented well enough that they survive scrutiny without a call.

Evidence base: Myriade's public security posture includes installation at the client, read-only mode, limited data preview, no data retention or training on customer data, exportable customer-owned context, and zero-knowledge encryption described as forthcoming — each a statement an enterprise buyer will want evidenced. GDPR articles 24 to 28 govern controller and processor arrangements. The AI Act's Article 50 transparency obligations applied from 2 August 2026 under Regulation (EU) 2026/1744. CNIL guidance on AI systems using personal data stresses purpose definition, data minimisation, output controls and monitoring for drift.

Open question: Which recurring customer diligence questions still require you personally to reconstruct the answer?

Where this document is thin

- No audited financial statements, recurring revenue, growth rate, gross margin, burn or runway figures are public.
- No cap table, institutional investor list or funding announcement was found; whether the company has raised externally is unknown.
- Customer concentration, retention, win rate, implementation effort and average contract value are not public. The customer names, the dozen-account figure, the 3,500 analyses a month, the one-to-two days recovered and the 27% to 40% cost reduction all originate from the company's own May 2026 release and have not been independently verified.
- Current headcount is uncertain. Third-party databases show around twelve; the company's own LinkedIn band reads 2 to 10; the May 2026 release said two to three further hires were planned by year end.
- No complete organisation chart is public, and the division of responsibility between the founder and the marketing co-founder is not documented.
- No public technical documentation independently validates the portability and context-layer claims in the May 2026 openness benchmark; the company labels some of them self-assessed pending documentation.
- No public statement sets out an international expansion plan, geographic revenue mix or target vertical mix; the stated 2026 focus is the French market.
- Whether the concentration of early customers within one corporate network is a deliberate strategy or a starting condition is not addressed publicly.
- Whether Myriade acts as data controller, processor or neither across its deployments is not documented, and it determines the GDPR position.
- Whether the company or its customers treat it as in scope for NIS2 depends on activity, size and national implementation, none of which can be established from public sources.
