

Eneco België

Deep Research Report

The company, its market, its competitors, its commercial model, its assets, its technology and its organisation — with three challenge cards for the AI Immersion.

SUBJECT	Eneco Belgium NV (KBO 0683.948.879) and its Belgian sister entities, within N.V. Eneco group context
PREPARED FOR	The TCS AI Immersion with Eneco België
METHOD	Fifteen parallel research workstreams across three waves, merged and stress-tested by independent adversarial verifiers, and cross-checked against the TCS pursuit report
BASIS	Public sources only. Vendor material is attributed to its vendor. Belgian entity financials are deliberately not asserted — see the validation agenda.
CLASSIFICATION	TCS Confidential — internal use

Business Profile

Identity and basics

Eneco Belgium is the Belgian operation of Eneco Group, a Dutch integrated energy company headquartered in Rotterdam and owned since March 2020 by Mitsubishi Corporation and Chubu Electric Power. It is Belgium's third-largest energy supplier, its largest single solar producer, and holds the largest flexibility position in the country.

Legal name	Eneco Belgium NV
Enterprise number	0683.948.879 · status actief
Registered seat	Blarenberglaan 2c, 2800 Mechelen — moved within Mechelen with effect from 1 June 2026, from Battelsesteenweg 455
Sites	Mechelen (HQ, supply) · Wavre (generation) · Ghent / Sint-Denijs-Westrem (solar). No Brussels office.
Incorporated	3 November 2017; Flemish electricity and gas supply licences granted 19 December 2017
In Belgium since	2004, originally through the Dutch entity Eneco België BV (0867.055.086), whose Belgian activity ceased 1 December 2023
Employees	Approximately 350 across the three Belgian sites
Customers	More than 1 million residential connection points plus 55,000 business connections
Managing Director	Bert (Albert) Clinckers — director from 19 November 2022, gedelegeerd bestuurder from 15 December 2022
Languages served	Dutch and French. No English, no German.

The defining transaction. Eneco entered Belgium in 2004 but became a top-three supplier in a single step: the March 2017 acquisition of Eni gas & power NV and Eni Wind Belgium NV, which delivered the million-plus household base it still runs on today.

One figure to settle. Eneco's own Belgian boilerplate says more than one million residential connection points — EANs, so a dual-fuel household counts twice. Microsoft's 2025 customer story about Eneco Belgium is titled "...to better support over 1.5 million customers". The two are not reconcilable from outside; they count different things.

Business group map

Ownership chain

Mitsubishi Corporation (80%) + Chubu Electric Power (20%) → Diamond Chubu Europe B.V. → N.V. Eneco (Rotterdam, founded 1 January 1995) → Eneco Belgium NV (Mechelen).

The consortium agreed the purchase from 44 Dutch municipal shareholders on 25 November 2019 for €4.1 billion excluding net debt, completing 25 March 2020. The commitments given then — Rotterdam headquarters, the Eneco brand, the One Planet Plan and the Dutch two-tier board — remain in force.

Two consequences reach directly into Belgium. The financial year moved to 1 April – 31 March to match the Japanese parent, so "FY2024" means the year ended 31 March 2025. And Japanese ownership brings J-SOx internal-control obligations that flow down into Belgian financial reporting and IT systems.

Mitsubishi carried ¥144.9 billion of goodwill on Eneco at 31 March 2025 and names it as an impairment risk factor. Eneco's contribution to Mitsubishi's profit ran ¥37.0bn → ¥25.6bn → ¥31.0bn, and then swung to a ¥0.8 billion loss in Mitsubishi's Q1 FY2026, against +¥0.6bn a year earlier. S&P describes Eneco as of "moderate strategic relevance" to Mitsubishi and caps its rating one notch below the parent's.

Belgian legal entities

ENTITY	NUMBER	SEAT	ROLE
Eneco Belgium NV	0683.948.879	Mechelen	The supply company
Eneco Wind Belgium NV	0475.012.760	Wavre	Belgian generation. Capital €153.5m. Absorbed Diamond Offshore Wind Holdings II, February 2022
Eneco Solar Belgium NV	0819.431.848	Ghent	Solar development and operation
Eneco BV	0543.792.292	Belgian registration of the Dutch entity	Corporate director of Eneco Belgium NV since 3 November 2017, represented by Selina Thürer since 19 November 2022
Eneco België BV	0867.055.086	—	Legacy vehicle. Belgian activity ceased 1 December 2023

Eneco eMobility also trades in Belgium; its Belgian incorporation status could not be established.

Group footprint

Five markets — Netherlands, Belgium, Germany, United Kingdom and, from June 2026, Poland — with 5.1 million customer contracts and roughly 2.8 GW of owned renewable capacity. Belgium is approximately 20% of the group's customer relationships on under 10% of its headcount.

Belgium is a market, not a division. The group is organised functionally — Customers, Integration, Assets — and Belgium

splits across two entities with different reporting lines. There is no Belgian member of either the Management Board or the Supervisory Board. The one hard governance link is Selina Thürer, group COO Customer, on the Belgian board since November 2022.

The Belgian asset base

Onshore wind	294 MW — 134 turbines operating across 28 parks, plus two under construction
Offshore wind	857 MW gross — Norther 369.6 MW (50%), SeaMade 487 MW (12.5%)
Solar	450,000+ panels across 300+ sites; last published aggregate 100 MWp (March 2021)
Storage	400 MW / 1,540 MWh under control by 2027 — of which 50 MW owned
Aggregate	1,458 MW managed, 690 MW owned in Belgium at March 2025

Onshore, Flanders — 30 turbines, 87.3 MW. Arendonk 7/16.1 (2011) · Zeebrugge-Cobelfret 5/18.0 (2021) · Zeebrugge-Toyota 2/6.0, Zeebrugge-WWL 2/6.0, Zeebrugge-Visveiling 1/3.6 (2022) · Beerse Absheide 2/7.2 · Turnhout II 2/5.8 · Eeklo 2/4.6 · Puurs 2/4.6 · Turnhout 2/4.4 · Puurs-Sint-Amands 1/4.2 · Willebroek 1/3.4 · Zelzate 1/3.4.

Onshore, Wallonia — 104 turbines, 206.7 MW. Fosses-la-Ville/Mettet 15/31.2 · Marbais 11/22.0 · Éghezée 11/19.5 · Boneffe 9/18.0 · Pont-à-Celles 8/16.0 · Perwez 8/12.0 · Ciney 6/15.0 · Gembloux-Sombreffe 6/9.0 (2003 — the first wind farm in Wallonia) · Gouvy 5/11.5 · Neufchâteau 5/11.0 · Fauvillers 5/10.0 · Warisoulx 5/10.0 · Molenbaix 4 of 5 · Arlon-Messancy 3 of 6 · Berloz-Geer 3 of 7.

Reconciling the turbine counts. Eneco publishes 126, 131 and 136 across its own properties. 131 is frozen press boilerplate. 126 is the only figure labelled "onshore", accurate at February 2025. 136 is the current live figure — and a bottom-up build gives 134 operating plus two under construction, which is exactly 136. Note that park fact-boxes count Eneco's turbines, not all turbines in the park. The "206 MW / 98 turbines" on the corporate wind page is a 2021 snapshot, and 206.7 MW coincidentally equals today's Walloon subtotal.

Offshore

FARM	CAPACITY	STAKE	SUPPORT	OFFTAKE
Norther — 44 × V164-8.4 MW, 23 km off Zeebrugge, operational June 2019, concession to April 2043	369.6 MW	50% (with Elicio)	Green certificates at €124.00/MWh LCOE over 19 years	50% of output
SeaMade — Mermaid 235 MW + Seastar 252 MW, 58 × SG 8.0-167, 40-50 km off Ostend, operational end-2020	487 MW	12.5% (Otary RS 70%, ENGIE Electrabel 17.5%)	LCOE €79.00/MWh, agreed 31 October 2017 — 36% below Norther	100% of output, under the PPA of 11 December 2018

The single most important commercial fact in the Belgian business: Eneco takes 100% of SeaMade's roughly 1.8 TWh on 12.5% equity — eight times more energy than it owns. This is the backbone of the "100% Belgian green" claim and of the INEOS, Borealis and Aurubis contracts.

Storage

ASSET	SIZE	LIVE	STRUCTURE
Ville-sur-Haine	50 MW / 200 MWh	18 February 2025	Eneco-owned. 53 Tesla Megapacks. Belgium's largest at commissioning
D-STOR, La Louvière	50 MW / 140 MWh	Summer 2026	Owned by BSTOR and Duferco; Eneco dispatches under a flexibility purchase agreement. €70m+, EPC by Equans
Storm — Ruien	200 MW / 800 MWh	2027	Storm-owned; ten-year Eneco control. Tesla-supplied
Storm — Langerlo	100 MW / 400 MWh	2027	As above

Eneco has bought the right to dispatch rather than the assets. It is the clearest strategic choice visible in the Belgian portfolio: the country's largest flexibility position on a fraction of the balance sheet — which makes the commercial terms of those agreements, not engineering, the determinant of what it earns.

Corporate power agreements in Belgium. INEOS 65.5 MW / 250 GWh over 10 years from SeaMade (12 January 2022, the largest in Belgium at the time) · Google 54 MW over 10 years across three onshore farms for its Belgian data centres (8 October 2025) — the first structural break from offshore sourcing, alongside Google's €5bn Belgian data-centre expansion · Borealis 150 GWh/year over 10 years on Seastar (7 December 2022) · Aurubis Olen 12 MW / 105,120 MWh over 10 years (28 July 2022).

Pipeline. Roughly 27 onshore projects totalling about 370 MW, of which ~101 MW is repowering of Eneco's own 2003-12 Walloon fleet. Offshore: the Princess Elisabeth Zone consortium with Ocean Winds and Otary (formed 12 July 2024), bidding across ~3.5 GW. Lot I was launched November 2024, postponed 1 July 2025, and a revised framework approved 24 July 2026 for commissioning by 1 October 2031.

Exits. The 870 MW Manage/Seneffe gas project is the one significant Belgian exit — withdrawn 22 September 2023 as incompatible with the 2035 decarbonisation commitment, permit annulled by the Council of State 31 March 2026 and formally refused by Wallonia 29-30 July 2026. No Belgian equity disposals 2020-2026, only downward transfers to local cooperatives (CLEF at Molenbaix, Lucéole at Fauvillers).

What they sell

Residential energy

Tariff card series BC_032_012608, valid 1–31 August 2026, incl. 6% VAT.

PRODUCT	TYPE	PRICE	FORMULA	FEE/YR	REGION
Zon & Wind Vast	Fixed, 1 year	Single 20.28 c€ · Day 22.77 · Night 18.14	Frozen 12 months	€65	Flanders, Wallonia
Zon & Wind Flex	Variable, monthly	15.41 c€	$(0.102 \times \text{BELPEX-RLP-M} + 3.058) \times 1.06$	€65	Flanders, Wallonia
Zon & Wind Dynamisch	Hourly	hourly	$(0.102 \times \text{BELPEX-H} + 1) \times 1.06$	€100	Flanders only
Aardgas Vast	Fixed, 1 year	8.64 c€	—	€65	Flanders, Wallonia
Aardgas Flex	Variable, monthly	6.76 c€	$(0.1 \times \text{TTFDAW-RLP-M} + 1.074) \times 1.06$	€65	Flanders, Wallonia
Injection addendum	Variable	6.38 c€	$0.084 \times \text{BELPEX} - 2.8$	€124.63/connection	Flanders, Wallonia

Indices on the July 2026 cards: BELPEX-RLP-M €112.5292/MWh, TTFDAW-RLP-M €52.9912/MWh, BELPEX injection €109.2498/MWh. Eligibility up to 50 MWh electricity and 100 MWh gas, low voltage to 56 kVA. Dynamisch additionally requires a digital meter configured to SMR3. French-language equivalents are branded Soleil & Vent and offer only Flex and Fixe. Business (KMO) cards price Flex at $0.102 \times \text{BELPEX-RLP-M} + 2.581$ with a €95 fee.

Two structural findings. The fixed-price premium is the widest in the market: Flex sits 4.87 c€/kWh below Vast, so at 3,500 kWh Eneco's fixed product costs roughly €1,517–1,523 a year against €1,321 for the cheapest supplier. And household solar injection has effectively closed: 6.38 c€/kWh on a typical 2,000–2,500 kWh export yields €128–160 a year against a standing administration charge of €124.63.

Beyond commodity

PROPOSITION	PRICE	VALUE	CONDITIONS
Slimme Thuisbatterij (26 June 2025, a Flanders first)	€5,000–10,000 all-in, ~6-year payback	Grid-balance reward up to €250/year	Minimum 1,500 kWh/yr. No dynamic contract required
Zonnepanelen (Energreen)	8 panels €4,124 · 14 €5,855 · 20 €7,853	SigenStor battery €4,490–5,427	6% VAT on homes 10+ years old
SlimLaden EV optimisation	Free	€0.015/kWh; claims €200/yr and +20% solar self-consumption	Flanders only — explicitly not Wallonia. 14 car brands
Home charge point (Eneco eMobility)	Connectric® from €1,830; Alfen Pro from €1,930 ex-VAT	Free public charge card	Three-phase to 10 m
Heat-pump steering (NOX Energy, 26 Feb 2026)	Free — Eneco does not sell heat pumps in Belgium	Over €300/yr (~€192 consumption + €156 flexibility)	8 supported brands; digital meter
Boiler maintenance (HomeServe)	€8.30 – €22.09/month	Repairs to €500; hotel €200/night; heating €80/day	Max three claims a year
Insulation (Isolteam)	Roof €30/m² · cavity €21 · cellar €25	Renovation premiums €5–8/m²	—
Eneco Premium (app-only)	€24.50 first year incl. a P1 dongle worth €72.88; then €1.99/mo	Per-second data, daily euro breakdown, appliance-level analysis	WiFi and dongle
Comfort Bonus	Free, automatic	Month 1: bicycle/EV assistance, 24/7 tradesmen. Month 12: three extra years' warranty on five appliances; four advance payments to €300 covered on involuntary unemployment	Residential only

Business and corporate

Four purchasing formulas — Power Fix, Power Flex, Power Expert, Power Strategy — and four injection mirrors: Inject Flex, Inject Expert, Inject Strategy, Energysquare. Green sourcing offered as Belgian wind, Norther specifically, European wind or RE100, with certificate. Energysquare gives self-trading on forward and OTC markets, Belpex day-ahead, Elia imbalance and auctions, minimum 1 GWh/year injection. Business Battery covers peak shaving, arbitrage and flexibility revenue.

Two regulatory hooks drive current conversations: Peppol e-invoicing became mandatory 1 January 2026 (Eneco offers a NumNum route at 25% off), and the Flemish rooftop-solar obligation for sites above 1 GWh took effect 1 April 2026 at 12.5 Wp/m², rising to 15% roof coverage by 2030 and 20% by 2035, enforced by VEKA with a repeatable €400 per missing kWp fine.

A vocabulary note. Eneco Belgium never uses the term "PPA" on its Belgian pages — Power Strategy, Inject Strategy and Energysquare are the functional equivalents. Separately, Eneco publicly argues against group-purchase campaigns and operates no referral programme, in a market where those campaigns are a named driver of switching.

Service terms

Payment falls due in 15 days under the general conditions (article 9.2) and 18 per the help pages — both are published. Advance payments are monthly and customer-adjustable; on renewal the advance is not automatically re-based. Settlement is issued on receipt of grid-operator readings with no published deadline; in practice 6–8 weeks after readings arrive. Notice: three weeks for the customer, two months for Eneco. Complaints: five working days by email; the general conditions promise only "as quickly as possible".

Dunning. Three reminders a year free, then €7.50 plus postage. Formal notice €20 Flanders, €15 Wallonia and Brussels. Lump sums €20 below €150, €30 + 10%, or €65 + 5% capped at €2,000 — except Wallonia, which applies no scale and caps at €55 per year per energy source. Business: €15 and €25. End state: contract drop in Flanders, budget meter in Wallonia. Agencies: Intrum and Flanderijn.

Negative prices. The residential formula has no zero floor, turning negative below an index of €33.33/MWh, though the monthly index insulates households from single hours. For business the position is explicit: Eneco's own page states injectors pay to inject during negative hours.

Business model and revenue

Eneco Belgium earns from six distinct mechanisms. The first two are visible in its own published tariff formulas and can be decomposed precisely.

1 • Commodity margin — the adder inside the formula

Every variable tariff is a pass-through index plus a fixed adder. Decomposing the published August 2026 formulas:

PRODUCT	INDEX COEFFICIENT	FIXED ADDER	READ
Electricity Flex, residential	0.102	3.058 c€/kWh	Pure pass-through would be 0.100 — the 0.102 is a 2% volumetric uplift on the commodity, on top of the adder
Electricity Flex, business (KMO)	0.102	2.581 c€/kWh	0.477 c€/kWh — about 16% — below residential, consistent with larger volumes
Electricity Dynamisch	0.102	1.000 c€/kWh	A third of the Flex adder, offset by a €35 higher standing charge
Gas Flex	0.100	1.074 c€/kWh	Exact pass-through, no volumetric uplift, and roughly a third of the electricity adder
Injection	0.084	−2.8 c€/kWh	Eneco passes through only 84% of the index and deducts 2.8 c€/kWh

Illustrative arithmetic, derived from published tariffs and not a company figure: at 3,500 kWh a residential Flex electricity customer generates roughly €107 of gross energy margin plus €65 of standing fee — order €170 a year before cost to serve. Dynamisch generates about €35 of adder plus €100 standing, so it is broadly margin-neutral against Flex at that volume and better only at higher consumption. The asymmetry between the 0.102 sales coefficient and the 0.084 injection coefficient means a prosumer household is materially less valuable per kWh than a pure consumer.

2 • Standing and administrative fees

€65/year residential energy · €95/year business · €100/year Dynamisch · €124.63/year per injection connection (€103 business) · dunning fees from €7.50 to €65 + 5% · a €1.99/month app premium tier. On more than a million connections this is a substantial, volume-insensitive revenue line — and the injection charge is the one that has quietly closed the solar proposition.

3 • Services and hardware

Solar installations from €4,124, batteries at €5,000–10,000, charge points from €1,830, insulation by the square metre, and recurring subscriptions for boiler cover at €8.30–22.09 a month. These are margin-on-hardware plus annuity, mostly delivered through partners — Energreen, HomeServe, Isolteam, NOX Energy — so Eneco takes an origination and orchestration margin rather than a build margin.

4 • Generation revenue

Two mechanisms, both fixed years ago. Norther earns green certificates at a €124.00/MWh LCOE over 19 years. SeaMade sits at an LCOE of €79.00/MWh agreed October 2017 — 36% lower, struck barely a year later. Beyond the support envelope, output is sold merchant or into corporate contracts.

5 • Flexibility and trading

Battery arbitrage and imbalance, ancillary services, and capacity remuneration — the October 2025 auctions cleared at €14,100/MW/year for 2026–27, €25,100 for 2027–28 and €27,300 for 2029–30. Crucially, on 350 of the 400 MW Eneco controls it earns a dispatch margin on someone else's asset, so the economics are contractual rather than ownership-based.

6 • Corporate contracts

Long-dated agreements — INEOS, Google, Borealis, Aurubis — that monetise the green attribute at a premium and lock volume for ten years.

What the model implies

The Belgian business is margin-thin per unit and fee-heavy, sourcing almost all its volume from two offshore assets whose support

terms were fixed in 2017–18, selling a fixed product priced at the top of the market, and increasingly earning from flexibility it does not own. Growth in beyond-commodity services is real but partner-delivered. The group does not publish a Belgian segment; segment EBITDA at group level splits roughly 36% renewables, 5% district heating, 59% commercial — a reminder that the customer business, not the asset base, carries the economics.

Financials and funding

All figures [GROUP]. Eneco does not publish a Belgian segment, and this report asserts no Belgian entity financials.

€ MILLION	FY2022 (YE MAR 23)	FY2023 (YE MAR 24)	FY2024 (YE MAR 25)	FY2025 (YE MAR 26)
Revenue	10,903	8,359	7,239	6,616
Gross margin	1,627	1,746	1,635	—
EBITDA	743	771	724	791
EBIT	345	394	341	383
Profit after tax	272	368	245	271
Investments and acquisitions	553	748	447	468
Cash flow from operations	—	29	639	1,475
Net debt / EBITDA	0.77×	1.91×	1.74×	—
Solvency	—	41.4%	44.7%	—
ROACE	7.2%	7.8%	5.6%	6.9%
Credit rating (S&P)	A–	A–	A–	A–
Employees (FTE)	3,340	3,810	3,778	—
Customer contracts (000)	5,430	5,229	5,147	—
Renewables owned (MW)	2,121	2,394	2,792	~2,800–3,000
Renewables managed (MW)	—	7,882	7,818	—
CO ₂ (Mt)	10.4	9.7	9.3	9.4
Customer satisfaction	84.0%	84.3%	85.5%	86.2%
eNPS	55	54	44	—

Earlier: FY2021 revenue €5,211m on a December year-end; the transition to a March year-end produced a 15-month period to 31 March 2023 with €13,219m of revenue. FY2023 revenue was later restated to €8,223m. CO₂ is 43% below the 2019 baseline.

Reading the trajectory. Revenue has fallen roughly 39% in four years, almost entirely a commodity-price effect as the 2022 crisis unwound rather than a loss of volume. Margin quality moved the other way — EBITDA reached its series high of €791m in the year to March 2026 and operating cash flow more than doubled to €1,475m. ROACE recovered from 5.6% to 6.9%, back above the internal 6% bar. Transition capex stepped down ~38% from its €748m peak.

Funding. Project finance at asset level — Norther on €867m of debt within a €1.2bn total cost; SeaMade on a €1.152bn facility. At group level S&P rates A– with a stable outlook, notes no financial covenants, describes liquidity as parent-dependent, and records the commodity book as hedged out to 2028. Its base case has capex at €520–540m a year, roughly €1.5bn across 2025–27, EBITDA rising to €880–900m by FY2028, and funds from operations to debt strengthening from 38% to 51–55%. Digitalisation capex was €67m.

S&P's stated downside triggers: deterioration in shareholder credit quality; FFO to debt falling toward 50%; a March-versus-December swing greater than 10 percentage points; weaker wind resource; loss of retail share; and negative margin calls. An upgrade is described as unlikely while the rating is capped one notch below Mitsubishi's.

Market position and competitive landscape

The Belgian market

Belgium is four regulatory arenas — Flanders (VREG), Wallonia (CWaPE), Brussels (BRUGEL) and the federal level (CREG) — over one transmission system.

Demand is flat within ±1%: Elia system load 78.9 TWh (2023), 80.5 (2024), 80.1 (2025), against domestic generation of 67.3 TWh and net imports of 12.7–14.0 TWh, roughly 17%. Connection points in 2024: 6,281,627 electricity (Flanders 3,647,459 · Wallonia 1,948,978 · Brussels 685,190) and 3,596,152 gas.

Supply mix 2025: nuclear 34% · renewables 34% at 22.4 TWh · gas 19%. Solar generated 10.1 TWh, up 21%; wind 12.3 TWh. Installed: 11.6 GW solar (+10%), 3.6 GW onshore wind in Elia's scope, 2,262 MW offshore, 2,020 MWe nuclear. Carbon intensity rose 28.5g to 181.7g. Belgium repealed the 2003 nuclear phase-out in May 2025, and on 30 April 2026 opened negotiations with ENGIE to take over all seven reactors — staff, subsidiaries, assets and liabilities — targeting agreement by 1 October 2026.

Prices. Belpex averaged €70/MWh in 2024, €82.5–83 in 2025 and roughly €85 in 2026 to date. Negative-price hours: 404 (2024) → 518–520 (2025), 5.9% of the year, floor –€462.30/MWh on 11 May → roughly 11% of 2026 hours at or below zero. An all-in household electricity price of €0.2738/kWh, about €1,286 a year, is roughly 37% energy, 30% network, 27% taxes and levies, 6% VAT. Wallonia's own decomposition of a €1,211.29 bill: energy €558.69 (46.1%), distribution €286.50, federal surcharges €183.30,

green certificates €105.94, transport €74.24. Only ~45% of a Walloon electricity bill is the commodity.

Switching — the defining condition of the retail market:

REGION	SEGMENT	2025	CHANGE
Flanders	Electricity, all	19.35%	+0.95pp
Flanders	Electricity, households	18.94% — 562,481 switches	+0.97pp
Flanders	Electricity, business	21.09% — 148,762 switches	+0.85pp
Flanders	Gas, all	20.41%	−0.93pp
Brussels	December switches	6,517 electricity / 4,499 gas	+18.7% / +26.6%

Since 1 July 2025 the V-check access code has been compulsory on every invoice and renewal letter. The regulator links the 2025 step-up directly to it, to new entrants, and to twice-yearly group-purchase campaigns. Concentration is easing in Flanders — top-three electricity share down to 74.0% from 77.7% in 2022, a third consecutive fall — but Brussels is the mirror image, with a Herfindahl index of 5,594, a top-three share of 92.4% and ENGIE alone at roughly 73%. Licensed supplier counts run far ahead of active ones: Wallonia licenses 157 but 14 sell to households; Brussels licenses 30, 9 sell; Flanders licenses 40 for electricity, 21 actively sell.

Digital meters — the constraint beneath every differentiated product:

REGION	INSTALLED	COVERAGE	DEADLINE
Flanders	4.83m (Sept 2025)	~80%	All digital by 1 July 2029
Wallonia	~489,000, heading to ~700,000 by end-2026	~28% of ORES low-voltage	80% communicating by 31 Dec 2029
Brussels	161,055 (Dec 2025)	~19%	46,000/year. Only ~5,000 are SMR3-configured — about 3% — and 58 dynamic contracts exist in the region

Electrification. Flanders holds 7,803.9 MW of solar across 1,089,669 installations (March 2026), having added 618 MW in 2025 — though Q1 2026 installations fell 35% year on year. Wallonia holds 2,979 MWp. Heat pumps reached ~35,000 units in 2025, up 13%, accelerating to +19% in 2026. Electric vehicles took 35% of new registrations — 145,170 units, 89% company cars — on ~450,000 vehicles served by 106,677 charge points, up 23%.

Capacity and grid. October 2025 auctions cleared 4,556 MW at €14,100/MW/year for 2026–27, 3,238 MW at €25,100 for 2027–28, and 4,690 MW at €27,300 for 2029–30. Roughly 800 companies sat in Elia's connection queue in April 2026; ~650 standard and ~650 battery requests queue in Flanders.

Hardship. Flanders 2025: 85,000 households with Fluvius as social supplier, average debt down 9.8% to €844.90, but 17,039 gas self-disconnections, up 9.2%. Brussels: total consumer debt €137 million, up €17m, at €258 per customer against €144 in Wallonia; disconnections 2,351 against 525 in 2021; 18,048 protected customers.

Market share

SUPPLIER	ELECTRICITY	GAS	OWNERSHIP
ENGIE Electrabel	40.57%	39.24%	ENGIE SA
Luminus	24.15%	23.79%	EDF 68.6%
Eneco	12.63%	13.91%	Mitsubishi 80% / Chubu 20%
TotalEnergies	5.89%	7.15%	TotalEnergies SE
Mega	3.38%	3.99%	MET Group 68.5% (closed 12 Aug 2025)
Ecopower	1.40%	—	Cooperative, 60,000 members

Regionally: Flanders — ENGIE ~40%, Luminus ~23%, Eneco ~10%. Wallonia — ENGIE ~45%, Luminus ~24%, TotalEnergies ~10%, Eneco behind. Brussels — ENGIE ~70%, TotalEnergies ~16%, Eneco absent from residential.

The three that matter most

ENGIE Electrabel — the incumbent. Three million customers, 7,300 staff, ~40% of both fuels, ~70% of Brussels, and roughly 8,300 MW of Belgian generation: Doel 4 and Tihange 3 at 89.8%, CCGTs, Coo pumped storage, and ~215 turbines at ~787 MW. The state takeover negotiation opened 30 April 2026, with a letter of intent signed, due diligence running, FANC approval required, decommissioning halted, and a dispute of roughly €3bn above the €8.7bn already provisioned. Whatever the outcome, it reshapes Eneco's largest competitor.

Luminus — the closest comparator. FY2025 revenue €3,120m, down 15%, net profit €146.1m, 2,943 staff, 1.8 million customers, 2,068,962 access points. Belgium's number-one onshore wind operator at 832 MW across 308 turbines, number one in hydro at 67 MW, 10.2% of Doel 4 and Tihange 3, and a 150 MW battery under construction at Navagne. Its EnergyControl P1-port proposition — real-time cost, peak and injection alerts, capacity-tariff shaving, claiming 5–15% savings — has passed 15,000 users and won Product of the Year 2025. It also outscores Eneco on the regulator's complaint indicator.

TotalEnergies — the digital challenger. Built on the €180m Lampiris acquisition in 2016. Number two in Brussels at ~16%. Its myDynamic product passes through hourly EPEX prices and extended into Wallonia on 1 January 2026. Roughly 8,700 charge points. It also carries the worst complaint-to-share ratio in the country.

Generation ranking in Belgium

1. ENGIE ~8,300 MW · 2. Luminus ~2,090-2,228 MW · 3. Eneco — 294 MW onshore, 857 MW offshore gross, 450,000+ panels, and the largest flexibility position at 400 MW of storage under control · 4. Elicio 110 MW Belgian onshore plus Rentel 50%, Norther 50%, SeaMade 12.5% · 5. Otary ~1,015 MW offshore. Then Aspiravi, EnergyVision, Storm, Trevion.

Consolidation and entry

MET Group closed its 68.5% purchase of Mega on 12 August 2025. DATS 24 — three years running the Test-Aankoop winner — exited household supply to EnergyVision on 30 July 2026, transferring 33,000 connection points. The ENGIE nuclear transfer is pending. At least ten new suppliers entered 2024-26: Belvus, Dots Energy, Ecofix, Ukko, Eddy Grid, Sparki, Energy Knights, Energy Together, Frank Energie Belgium, Enwyse.

Customers and social proof

Scale. More than 1 million residential connection points and 55,000 business connections — approximately 20% of the group's 5.1 million customer contracts.

Named Belgian business references. INEOS · Google · Borealis · Aurubis Olen · ArcelorMittal (12.77 MWp of solar, including a 27,104-panel Ghent rooftop completed September 2019 for €7.5m — the largest rooftop array in Belgium) · Audi Brussels (11.54 MWp) · Balta Weaving (6.82 MWp) · the Wienerberger group (5.95 MWp) · Volvo Ghent (5+ MWp, May 2024, which was Eneco's 500th sustainable asset group-wide) · TUI Zaventem · OH Leuven · WDP · Paradise City · Plopsaqua · Efteling.

Complaints — Federal Energy Ombudsman, 2024.

SUPPLIER	COMPLAINTS	SHARE
ENGIE Electrabel	4,898	42.76%
Luminus	2,152	18.79%
TotalEnergies	1,542	13.46%
Eneco	1,386	12.10%
Mega	876	7.65%
OCTA+ · Elegant	213 · 151	—
Bolt · Energie.be · DATS 24	55 · 54 · 34	—
Total supplier-attributed	11,455	−45.7% YoY

Eneco fell from 2,761 in 2023 and 3,230 in 2022 — a halving in one year, a genuine operational achievement. The Ombudsman nonetheless names TotalEnergies, Eneco and Mega as over-indexed relative to share. National category mix: meters 24.2%, billing 22.6% — 46.8% together — against prices 19% and payments 11.1%. This is an execution problem, not a pricing one.

Satisfaction and ratings. VREG's Q2 2025 star indicator: five stars to Bolt, DATS 24, Ecopower, Elegant, EBEM, Energie.be, EnergyVision, Luminus, Trevion and Wase Wind; four to Eneco, ENGIE, Frank and OCTA+; three to Mega and TotalEnergies. Test-Aankoop's 2025 survey of 6,206 respondents put DATS 24 first at 83/100 for a third year, with no supplier below four stars for the first time. Greenpeace's 2025 assessment placed Ecopower and Wase Wind at 20/20 and Eneco at 13/20 — still the greenest of the large suppliers — with OCTA+ at 4/20. Group customer satisfaction reached 86.2%.

Digital experience. The Eneco Smart Meter app rates 1.4 stars across 469 Google Play reviews with 100,000+ downloads and 1.8 stars across 91 App Store ratings. It is Dutch only. Review themes: crashes and blank screens, an endless Fluvius re-authorisation loop, and the absent French version — which Eneco's own developer reply attributes to the incomplete Walloon meter rollout. My Eneco self-serves invoices, advance amount, consumption, tariffs and product switching, but not termination, payment plans or complaints.

Leadership and people

Belgium

NAME	ROLE	BASIS
Bert (Albert) Clinckers	Managing Director, Eneco Belgium	KBO: director 19 Nov 2022, gedelegeerd bestuurder 15 Dec 2022, still active. Corroborated by the Belgian pressroom (20 Jan 2025) and a De Tijd op-ed (Nov 2025). Voice on the Manage withdrawal; publicly argues for time-of-use tariffs
Miguel de Schaetzen	CEO, Eneco Wind Belgium	Group release 12 Jul 2024; pressroom 18 Feb 2025; KBO permanent representative
Selina Thürer	Group COO Customer — and permanent representative of Eneco Belgium NV's corporate director since 19 Nov 2022	KBO and eneco.nl. The one hard governance line into Rotterdam
Erwin Leeuwis	Permanent representative of a corporate director, Eneco Wind Belgium NV	KBO
Ellen Van Caillie	Head of Conversational AI	Named in Microsoft's May 2025 customer story

Predecessors: Jean-Jacques Delmée (CEO from 1 September 2019), Christophe Degrez (to 2019). No Belgian country CEO has been announced since Delmée. A number of further Belgian names circulate on profile-aggregation sites; none could be corroborated primarily and none are carried here.

Group

NAME	ROLE
Martijn Hagens	CEO — appointed effective 1 March 2026, took up the role 2 March. Previously Senior Vice-President and Head of Business Area Markets at Vattenfall, a member of its Executive Group Management, and CEO of Vattenfall's Dutch organisation; over twenty years at Vattenfall, career begun at Accenture
Kees-Jan Rameau	COO Integrated Energy & Assets. Interim CEO 4 July 2025 – 28 February 2026
Nynke Dalstra	Chief Financial Officer
Yusuke Takeuchi	Chief Cooperation & International Officer
Selina Thürer	COO Customer
Vincent Tuk	Chief Digital Officer — not CTO, and not a Management Board member. Publicly emphasises multidisciplinary teams, "building a strong engineering culture" and "data and AI for everyone"
Mario Suykerbuyk	Group CIO

Supervisory Board: Mel Kroon (chair), Masaru Saito (vice-chair), Harold Naus (chairs Audit & Risk and Remuneration), Hanna Hennig, Takeyuki Sento, Yasuo Ohashi, Yukiko Morishita — four of seven seats Japanese-nominated.

Churn. As Tempelman was CEO from 20 July 2020 to 1 August 2025; three group CEOs in twelve months. Karen de Lathouder (COO Assets) left February 2026 and the seat was abolished on 1 March 2026, merging three units into two.

Workforce. Around 350 people in Belgium against 3,778 group FTE. Group engagement has fallen materially — eNPS 55 → 54 → 44. The December 2024 restructuring targeted 350 FTE group-wide to 31 March 2026; the release addressed the Dutch organisation, while the annual report attributes the resulting €95m — 15% — external-cost reduction to restructuring in Belgium and the Netherlands. No Belgian works-council or collective-redundancy procedure was found.

Public position. Eneco Belgium returns to four themes: time-of-use network tariffs (which it argues for, and Belgium has deferred to 2029); the value of residential solar (a "tipping point" at roughly €85/year of injection value); flexibility (positioning the home battery and grid-balance reward as Flemish firsts); and group-purchase campaigns, which it publicly opposes. It hosted the Eneco Green Energy Summit on 5 February 2026 in Ghent for around 350 delegates.

25 May – 23 Jun 2026	[BE] Oostkamp/Kampveld public inquiry — a 173 m turbine 450 m from homes beside a Natura 2000 site. The 2024 version was withdrawn after 850 objections
29 May 2026	[NL] Advocate-General advises the Hoge Raad to quash the Vattenfall price-clause ruling; judgment expected December 2026
15 Jun 2026	[GROUP] Hekla Energy majority stake — entry into Poland, the group's fifth market
25 Jun 2026	[GROUP] FY2025 results: revenue €6,616m, EBITDA €791m, net €271m, capex €468m, ROACE 6.9%. "The energy transition is losing steam... we will update our One Planet Plan" — outline due autumn 2026
26 Jun 2026	[BE] Storm contract — Ruien 200 MW / 800 MWh plus Langerlo 100 MW / 400 MWh, Tesla-supplied, ten years from 2027, taking managed battery capacity past 1.2 GW across 15 projects
6 Jul 2026	[NL] Ecowende (Hollandse Kust West VI) first power
24 Jul 2026	[BE] Revised Princess Elisabeth Zone Lot I framework approved — ~700 MW, two-sided CfD, no strike-price cap, ≥75% non-Chinese turbines, and the 50% PPA carve-out removed
29–30 Jul 2026	[BE] Wallonia formally refuses the Manage/Seneffe permit, citing changed European standards
30 Jul 2026	[BE] DATS 24 exits household supply to EnergyVision, transferring 33,000 connection points
1 Aug 2026	[BE] Tax shift step two — gas +€18.17/yr, electricity –€12.64/yr. The energiebijdrage is abolished
3 Aug 2026	[GROUP] Eneco swings to a ¥0.8bn loss in Mitsubishi's Q1 FY2026, from +¥0.6bn — a ¥1.4bn year-on-year deterioration. Still 80% consolidated

Risks and red flags

Severity is our assessment; evidence strength describes how well the item is sourced.

Belgium-specific

#	RISK	SEVERITY	EVIDENCE
B1	Sourcing concentration on SeaMade and Norther. Eneco offtakes 100% of SeaMade's 487 MW / ~1.8 TWh on 12.5% equity — the backbone of the "100% Belgian green" claim and of the INEOS, Borealis and Aurubis contracts. Two assets, both with support terms fixed in 2017–18	Critical	Strong
B2	The offtake model is being closed by tender design. The revised Princess Elisabeth framework removes the 50% PPA carve-out from the two-sided CfD — the mechanism that lets Eneco source a national retail book from minority stakes	Critical	Strong
B3	Atrias/MIG6 market-message defect. Roughly 3,000 Flemish, 7,500 Walloon and 500 Brussels access points blocked six months or more; VREG fined Fluvius €120,190 plus €2,500/day, ~€500,000 accrued by May 2025. Suppliers carry the unbilled receivable and late-payment interest, with no compensation scheme. Eneco is not named in any penalty	High	Strong on the defect; nothing Eneco-specific
B4	Storm counterparty and delivery concentration. A third of the 1.2 GW headline rests on one developer, one hardware supplier and one delivery year (2027). No availability guarantees or liquidated damages are disclosed	High	Strong on structure; nothing on terms
B5	Grid connection queue. ~650 distribution dossiers and ~650 battery projects queuing in Flanders; ~800 companies in Elia's queue at April 2026. Ruien and Langerlo are both due in 2027	High	Strong
B6	Ferranti change of control, 28 May 2026 — the stated Belgian billing vendor sold to private equity mid-programme, in a market with an unresolved market-message defect	High	Strong on the transaction; moderate on impact
B7	Greenpeace rating fall to 13/20 from 18/20, with reasons that include the shareholders' South-East Asian coal exposure. Eneco marketing material has continued to cite the older score	High	Strong
B8	Negative prices and capture-rate erosion on an almost entirely wind book — 520 hours in 2025, ~11% of 2026 hours to date	High	Strong data; moderate on net effect
B9	Local planning opposition. Oostkamp/Kampveld: unanimous negative council advice January 2025, 850 objections to the earlier version, and a March 2026 noise measurement showing +1 to +7 dB at night	High	Strong
B10	Fixed-tariff price exposure. The fixed product is priced at the top of the market in a country with 19–21% annual switching and a mandatory comparison code on every bill	High	Strong
B11	Manage/Seneffe permit annulled and then refused — a written-off development position, though Eneco had already exited in 2023	Medium	Strong
B12	Service reputation divergence. Group satisfaction of 86.2% and a four-star regulator rating sit beside a 1.4-star app on 469 reviews and no French-language app at all	Medium	Strong

Group and Netherlands

#	RISK	SEVERITY	EVIDENCE
G1	WAMCA mass claim [NL] against six suppliers including Eneco over variable-tariff price-change clauses, with 275,000+ registrations and a hearing on 15 September 2026. Eneco's Belgian Flex products use exactly this kind of indexed clause, so the reasoning — though Dutch — is worth understanding	High	Strong
G2	Hoge Raad ruling due December 2026 [NL] on the Vattenfall price-clause case; the Advocate-General has advised quashing the lower ruling. A binary swing factor that would largely defuse G1 if supplier-favourable	High	Strong
G3	Goodwill impairment at the parent. ¥144.9bn carried on Eneco; Mitsubishi names it as an impairment risk factor; the contribution ran ¥37.0bn → ¥25.6bn → ¥31.0bn and then to a Q1 FY2026 loss of ¥0.8bn	High	Strong
G4	S&P downside triggers — shareholder credit quality, FFO/debt toward 50%, a March-versus-December swing above 10 percentage points, weaker wind, retail share loss, negative margin calls. Rating capped one notch below Mitsubishi; Eneco described as of "moderate strategic relevance". No financial covenants; liquidity parent-dependent; hedged to 2028	High	Strong
G5	Ownership and strategic uncertainty. Mitsubishi's Corporate Strategy 2027 divestiture line naming Eneco. The document line is unambiguous; its meaning is not, and every corroborating indicator of a live disposal is absent — no announcement, no process, no adviser, and Chubu is still co-investing alongside Eneco	Critical if real; low probability on current evidence	Moderate
G6	Leadership churn and engagement. Three CEOs in twelve months, a board seat abolished, and eNPS down 55 → 44	High	Strong
G7	Strategy in flux. The One Planet Plan is being rewritten, with an outline due autumn 2026 and affordability and security of supply added to the frame	High	Strong
G8	Dutch district-heating pricing controversy — reputational read-across risk only; Belgium has no heat network	Medium	Moderate
G9	Cyber and control environment. Eneco has disclosed that deficiencies were identified in its IT General Controls under J-SOX, assessed as not material, with multi-year remediation. ISO 27001 or CyFun® certification is due April 2027	Medium-High	Strong
G10	Supply chain and turbine availability on the 2027 pipeline	Medium	Moderate

Clear negatives — searched specifically, not found

No regulatory action against Eneco by CREG, VREG, CWaPE, BRUGEL, the FSMA, the Belgian Competition Authority or the Belgian Data Protection Authority — the billing penalties fell on Fluvius, not on suppliers. The ACM's 2023 tariff investigation closed with no fine. No FOD Economie or Test-Aankoop action against Eneco. No Belgian data breach, GDPR complaint or major outage — the two known incidents (January 2021 credential stuffing, May 2024 AddComm) are Dutch. No Belgian works-council or collective-redundancy procedure. No announced or reported Eneco sale, IPO or disposal, and no statement of intent by Mitsubishi or Chubu. No successful greenwashing action anywhere in the group — a 2022 Dutch case upheld the 100%-green claim, and no Belgian complaint exists. No other Belgian court case involving Eneco. No covenant breach — S&P confirms none

exist. No Belgian equity disposal 2020–2026.

Future outlook

The strategy is being rewritten, on a date inside the engagement window. With the FY2025 results, Eneco stated that "the energy transition is losing steam, and we will update our One Planet Plan to reflect this." The stated triggers are grid congestion, weak heat-pump and EV demand, falling capture prices, Middle East volatility, and affordability and security of supply. An outline is due in autumn 2026.

What the One Planet Plan currently commits to. Eneco and its customers climate-neutral by 2035 against a 2019 baseline of 13.9 Mt; 300,000 homes on heat networks by 2035 [NL]; no stand-alone gas boilers sold from 2025; 100% green power to all business customers by 2030; biodiversity net-positive from 2025 with a 110% nature-improvement standard on onshore sites. BCG validated a 65–75% reduction by 2035.

The capital envelope. Roughly €1.5bn across 2025–27, targeting 4 GW of owned renewables by 2028 — against 2,792 MW owned at March 2025. S&P models EBITDA rising to €880–900m by FY2028 and FFO/debt strengthening to 51–55%. No new thermal generation anywhere in the group.

What is dated and visible for Belgium

WHEN	WHAT
Autumn 2026	Revised One Planet Plan outline published
1 Oct 2026	Target date for agreement on the state takeover of ENGIE's nuclear fleet
Nov 2026	Full quarter-hourly price history enters the V-test comparison
1 Jan 2027	Excise step three; EU ETS2 begins. Cumulative bill effect +€14.00/yr
Apr 2027	ISO 27001 or CyFun® certification due under NIS2
2027	Storm's 300 MW delivers; managed battery capacity reaches the 1.2 GW headline
1 Jan 2028	Excise step four. Cumulative +€22.30/yr
2028	Group target of 4 GW owned renewables; commodity book hedged to here
1 Jan 2029	Excise final step — gas +€4.38/MWh, electricity –€11.4/MWh. Cumulative +€35.30/yr
2029	Time-of-use network tariffs, deferred from 2026
1 Jul 2029	Flanders — all meters digital, unlocking the full addressable base for dynamic and flexibility products
31 Dec 2029	Wallonia — 80% of meters communicating, closing the regional product gap
2030	100% green power to all business customers; Walloon solar target 5,100 GWh; Belgian battery fleet ~4 GW
1 Oct 2031	Princess Elisabeth Zone Lot I commissioning
2035	Climate-neutral commitment; Doel 4 and Tihange 3 contracted to here

The honest read. Belgium's next three years are shaped by things largely decided elsewhere: a group strategy being rewritten in Rotterdam, a nuclear restructuring that reshapes its largest competitor, a tender design that removes the offtake mechanism its retail book depends on, a meter rollout that governs which products it can sell to whom, and an excise shift on fixed statutory dates. The two levers genuinely in Belgian hands are how it earns from the flexibility it has contracted and how well it executes the customer chain it already owns.

Technical Profile

Technology stack

How technology is organised

Eneco Tech, at group level, publishes six units: CTO Office & Partner Management · Cyber Security (within IT Risk, Security & Compliance) · Data & AI · Enterprise IT Solutions · Product & Design · Software Engineering. It runs full-cycle product teams on a "you build it, you run it" basis with 24/7 on-call, a dedicated Platform Engineering function, a Group Product Manager per domain, and a Tactical Partner Manager role inside the CTO Office.

In Belgium the function is Data & Technology Services (D&TS), described by Eneco as "the mirror of our organisation", split into SIMS (commercial) and CS (operational), each with its own management layer, running SAFe with both a Product Owner and a Scrum Master per team. Named Belgian applications include EES and HEMS. Belgium works "in close collaboration with the Digital team of our parent company in the Netherlands".

Belgium has no local equivalent of Platform Engineering, Data & AI or Cyber Security as standalone units. Those capabilities sit in Rotterdam. The culture comparison later in this report explains why the framing difference between the two organisations matters.

The systems estate

LAYER	WHAT IS EVIDENCED	BASIS	GEOGRAPHY
Customer information, billing, meter-to-cash	Ferranti MECOMS 365 on Dynamics 365 and Azure — CIS, meter data management, CPQ, Field Service, Customer Engagement, Finance & Operations. Partnership announced 2 May 2024	Vendor only	Belgium

ERP	SAP, migrated to Azure, with a HANA/S4HANA roadmap	Corroborated	Group / NL
CRM and service	Dynamics 365 Customer Service with Copilot and Digital Contact Center, delivered with Capgemini — Belgium first, then the Netherlands	Corroborated	BE → NL
Conversational	Microsoft Copilot Studio with Azure AI Conversational Language Understanding and Azure AI Translator; live-chat handover via Seamlly; built with Belgian partner Reimagine AI	Corroborated	BE → NL
Legacy conversational	CM.com Conversational AI Cloud / DigitalCX, since March 2019	Vendor	Netherlands
Trading	"Chronos" — a full trading-IT overhaul named in the FY2024 annual report. The underlying ETRM product is not disclosed	Corroborated	Group
Virtual power plant	Myriad, built in-house from July 2023, ~40 FTE of which ~12 from partner Utilus; .NET/C#, Azure, Kafka, Terraform, Kubernetes. Aggregates ~4 GW	Corroborated	Netherlands
Data	Databricks and Snowflake lakehouse with Unity Catalog, dbt, Airflow, Collibra and Kafka — with machine learning on AWS, a deliberate multi-cloud split	Job advertisements	Group / NL
Belgian data platform	A Mechelen Product Owner – Enterprise Data Platform role names Azure data services and Snowflake, lakehouse, governance and quality, on a platform "transitioning toward operational maturity" — Eneco's own words	Primary	Belgium
Operational technology	SCADA and PLC estate on IEC 60870-5-104, OPC-UA and Modbus, certified to ISO 27001 and IEC 62443	Job advertisement	NL assets and BE
IoT / flexibility	Azure PaaS IoT platform and communication hub, built with Conclusion	Corroborated	Group
Run / service desk	The SAP service desk is outsourced to TheValueChain	Vendor	Group
Belgian customer digital	My Eneco portal and the Eneco Smart Meter app; account.eneco.be advertises a .NET Framework 4.6.1 OIDC client	Primary	Belgium

The MECOMS question. Every claim that MECOMS 365 runs Eneco Belgium's meter-to-cash chain originates with Ferranti. There is no Eneco press release, annual-report mention, Belgian pressroom item or job advertisement anywhere that names MECOMS. The 2024 announcement carries an Eneco communications byline, which is the closest thing to endorsement, but scope, timeline and go-live state are unknown from outside. On 28 May 2026 Main Capital Partners took a majority stake in Ferranti (~285 staff, Antwerp), installing Tom Van Haute as CEO with a mandate including "further enhancing the MECOMS 365 proposition".

Partners. Ferranti (Belgium, 2024 — now Main Capital-owned) · Microsoft · Conclusion, which delivered the 2018-19 SAP-to-Azure migration (17.5 TB across 23 servers, first phase in seven weeks with zero downtime) and is retained for run · Capgemini (ten-year partnership plus a five-year Digital Technology Platform agreement from July 2022 explicitly covering Belgium) · Utilus · Reimagine AI · Seamlly · CM.com · Collibra, Databricks, Snowflake, AWS, SAP · S4 Energy · NET2GRID · Eniris · Energreen, HomeServe, Isolteam, NOX Energy.

Eneco Belgium is not a contracting authority, so Belgian public e-procurement records yield nothing.

Correction worth carrying: there is no evidence of any Eneco partnership with EnergyVille or KU Leuven — EnergyVille's industrial partner is ENGIE.

Product architecture

No architecture documentation is published, but the components are evidenced well enough to describe the shape of the estate in layers.

Layer 1 — Customer engagement. Web (eneco.be / eneco.be/fr, on Sitecore and Storyblok at group level), the My Eneco portal behind an OIDC client, the Eneco Smart Meter mobile app, and the Elli conversational surface across web chat, live chat, telephone voice and WhatsApp. Identity at group level runs on Okta at inloggen.eneco.nl; the Belgian portal appears to run its own client.

Layer 2 — Service and CRM. Dynamics 365 Customer Service with Copilot and Digital Contact Center, with Seamly for human handover and conversation summarisation on escalation.

Layer 3 — Core commerce and billing. The CIS, meter data management, pricing, quoting and invoicing layer — Ferranti's MECOMS 365 on Dynamics 365 Finance & Operations, per the vendor.

Layer 4 — The Belgian market interface. This is the layer that distinguishes Belgium from every other Eneco market: Atrias/MIG6 message exchange, and three separate distribution-system operators — Fluvius, ORES/RESA and Sibelga — with opt-in consent flows, three green-certificate regimes, three social-tariff regimes and three compensation scales. Eneco states there is no Walloon equivalent to Fluvius.

Layer 5 — Data. A Databricks and Snowflake lakehouse with Unity Catalog, dbt, Airflow, Kafka streaming and Colibra governance, with machine learning workloads on AWS. The Belgian enterprise data platform is a distinct, newer effort.

Layer 6 — Asset and flexibility control. The group VPP (Myriad, .NET/C#, Azure, Kafka, ~4 GW aggregated) and an Azure IoT platform, over a SCADA/PLC operational-technology estate. In Belgium the device-level intelligence is largely partner software — see the API and developer ecosystem below.

Layer 7 — Trading. "Chronos", plus a separate Azure API Management portal for Energy Trade.

The structural asymmetry

Layers 1 to 3 are increasingly Microsoft-standard and shared in pattern with the group. Layer 4 is irreducibly Belgian and has no equivalent anywhere else in Eneco — it is the reason a proposition designed once in Rotterdam needs Belgian rework three times over. Layers 5 and 6 are where the group holds capability Belgium does not.

One architectural question decides whether "align Belgium to the group platform" is even available: the Dutch customer API path is /dpxweb/v2/nl/eneco/ — country- and brand-parameterised, renamed from /v1/enecoweb/v2 in 2023. Whether Belgium is a tenant of that backend-for-frontend or a separate estate is not determinable from outside, and it is the single highest-value technical question to ask.

API and developer ecosystem

There is no public API programme, in any Eneco market. No /developers, /api or /partners developer page exists on eneco.be, eneco.nl or eneco.com; there is no public catalogue, no OpenAPI specification, no sandbox and no self-service keys.

What does exist is gated and internal. developer.enecogroup.com — "the Eneco API Developer Portal" — is SSO-locked, with a full development/test/acceptance/production chain indexed. Its route shape is the webMethods API Portal signature. A separate Azure API Management portal exists for Energy Trade. Before both, Devoteam publishes that Eneco ran Apigee Edge, and was engaged in November 2017 because teams were working "without consistent standards", with "API champions" as the remedy. Three API gateways in eight years, and no external surface at the end of it.

Belgian customer data access is a Fluvius consent flow, not an Eneco API. Eneco's own page documents the mandaat: authenticate at Fluvius with eID or itsme, select the meter by EAN, grant consent; the app then shows a green, orange or red permission state, and activation takes two to three days. There is no data export, no Green Button equivalent, and no customer-authorized third-party access.

The most consequential finding in this section: Belgium's flagship smart-device propositions are other companies' software.

- The home-battery app ships under the package identifier com.eniris.EnecoSlimmeThuisbatterij — a Belgian vendor's namespace, with Eneco as publisher.
- The Eneco Premium P1 dongle is NET2GRID hardware, from a partnership announced 30 January 2025. Notably, the integrator Eniris documents a local LAN read API on the Eneco-branded hardware — Eneco itself documents nothing.
- Smart charging descends from Jedlix, a company Eneco spun out in 2015. Jedlix publishes exactly what Eneco does not: developer.jedlix.com has documentation, SDKs, a free demo account and a vehicle simulator. Eneco appears as a client logo.

On the read of that: in Belgium, Eneco is an orchestrator rather than a builder of device intelligence. That is not automatically a weakness — it is demonstrably how Belgium ships fast — but it means the customer relationship and the data path both run through partners.

There is also a visible failed precedent for opening up. Toon was a genuine 2017 open-API play with Triggi, Homey, Achmea and BSH. developer.toon.eu now fails TLS hostname validation, and the community library toonapilib has had no release since July 2021. Any proposal to open APIs has to answer "why this time". (Note too that the Belgian Toon equivalent is Engie Electrabel Boxx — a competitor's channel.)

Clear negatives. No Home Assistant integration exists for Eneco Belgium, while hass-engie-be exists for Engie Belgium. No reverse-engineered Eneco Belgium API was found. No Enode or Exnaton relationship. No published Belgian VPP or flexibility platform — the D-STOR release says only "innovative steering technology".

Open source and engineering culture

Public engineering output

github.com/Eneco is real but dormant. Its notable repository, landscaper — a Go-based Helm and Kubernetes state reconciler cited in Helm's own documentation — had its last commit on 5 July 2018. kafka-connect-ftp and kafka-connect-twitter (Scala, under the com.eneco.trading namespace, from Energy Trade) last published to Maven Central on 11 March 2017. There is also an sre-challenge and an acs-engine fork. No meaningful public open-source output in roughly eight years, and nothing on npm, PyPI or GitLab.

No engineering blog. jobsateneco.com/blogs is employer branding, though about 14 of 17 posts are technical in subject — the VPP team, flex optimisation, forecasting — by named engineers (Daniel Enthoven, Sander Marijt, Daniel Horn, Amir Azar). All group or Netherlands.

One well-evidenced conference talk, and it is worth watching. At GOTO Amsterdam 2024, where Eneco was a Gold partner, Wesley Coetzee and Sebastian Du Rand presented "Spark Your Imagination: Eneco's Virtual Power Plant" on 11 June 2024, covering a two-and-a-half-year VPP build, its resiliency design and high data throughput. The recording is public on YouTube — the single best available window into how Eneco engineers actually build.

Vendor-published technical case studies: Databricks (Toon, an AWS lakehouse, 350,000 households, ten-second data) and Microsoft (the 2018 SAP-to-Azure migration). The multi-cloud split is real; no published rationale exists for it.

Culture — and the asymmetry that matters

The two organisations describe themselves very differently, in their own words.

	GROUP / NETHERLANDS	BELGIUM
Framing	"Full-cycle product teams; engineers own the entire journey from idea to deployment"	"A stable and reliable digital environment"
Structure	Six tech teams, a named Platform Engineering function, "you build it, you run it", 24/7 on-call	D&TS, mirrored into SIMS and CS, SAFe, a Product Owner and a Scrum Master per team
Dependency	—	Works "in close collaboration with the parent company's Digital team in the Netherlands"
Named capability	Data & AI, Cyber Security, Platform Engineering	EES, HEMS

The group frames itself as a builder; Belgium frames itself as a custodian. Combined with the finding that Belgium's device software is largely partner-owned, and that every technology vacancy is in Rotterdam, this is the most important cultural fact on the account — and it sits directly against the observable reality that Belgium is the market that shipped the group's most-cited customer capability first.

Practice evidence is thin. GitOps-style dry-run-then-approve appears in landscaper's 2018 README; resiliency and throughput claims come from the GOTO talk; Kafka streaming is confirmed; there is an SRE hiring challenge. eneco.be publishes an RFC 9116 security.txt.

Clear negatives. No evidence of AI-assisted development anywhere — no GitHub Copilot, Cursor or AI code review. No tech radar, architecture decision records or engineering handbook. No conference talk other than GOTO 2024, and no Belgian Eneco engineer speaking anywhere — including nothing at Devovx Belgium. Review-site sentiment was not obtainable and is therefore not reported rather than invented.

Data, AI and security posture

What is live in Belgium

Eneco Belgium runs Elli, a conversational assistant that replaced what Eneco itself called a "black box" chatbot and was built in three months. It runs 24/7 across web chat, live chat, telephone voice and WhatsApp, multilingual with real-time translation in both directions, with Seamlly handling human escalation and automatic conversation summarisation on handover. It transacts rather than merely answers: advance-payment adjustment, contract changes, outstanding-payment and missing-EAN alerts, bill payment and account opening, plus consumption advice in an "energy coach" framing.

METRIC	VALUE	SOURCE
Conversations fully contained without hand-off	67%, up from 40%	Microsoft customer story, 3 May 2025
Conversations handled — capacity	70% more	Same source, a different measure from containment
Chats per month	24,000, up from ~10,000	Same source
Intent recognition	over 95%	Same source
Call-time reduction	−90 seconds in Belgium, against −60 in the Netherlands	Eneco's own FY2024 annual report

Do not conflate the two headline figures. "70% of conversations resolved without hand-off" is a fusion of two distinct statistics and is wrong. Containment is 67%, up from 40%; the 70% figure is additional capacity. The first three metrics are Microsoft's, not Eneco's; the call-time figure is Eneco's own. Owner: Ellen Van Caillie, Head of Conversational AI.

Eneco's published Elli terms restrict it to general questions, warn of possible errors, bar credentials, medical and card data, and

permit processing by "Eneco or its partners".

Algorithmic steering in products. Live: the smart home battery with an annual grid-balance reward (26 June 2025, a Flanders first, automatic steering, no dynamic contract required) and SlimLaden EV-charging optimisation. Still a pilot at 26 February 2026: smart heat-pump steering with NOX Energy.

eMobility — Belgium first again. Capgemini publishes that Eneco eMobility deployed generative AI in Dynamics 365 customer care, reducing average wrap-up time by 50%, cutting training from four hours to one, halving licensing costs, and going live five weeks after ideation began. The case study is Capgemini's publication, not Eneco's.

Customer satisfaction, correctly attributed. Group satisfaction rose 84.3% → 85.5% (FY2024, which Eneco attributed partly to "AI-driven efficiency of customer services") → 86.2% (FY2025, which Eneco attributed to "further improvements to customer service by telephone and over digital channels" — with no AI attribution). This is a group figure across all countries and segments; no Belgian split is disclosed.

Where the capability sits

Modelling capability is in Rotterdam — Chief Digital Officer Vincent Tuk, roughly 600 technology staff, machine learning in trading and customer management. Myriad, the group VPP, is Netherlands (June 2023), and there is no evidence it extends to Belgium. Group AI language is recent: the FY2024 report says Eneco "continued to invest in digitalisation and AI"; the prior year's report mentions AI zero times. An enterprise-wide third-party AI maturity scan has reportedly been completed — worth asking about, since it would say more than any outside-in assessment. No evidence exists of Mitsubishi- or Chubu-originated AI capability, tooling or funding reaching Eneco Belgium.

Security, control and compliance

DATE	OBLIGATION
25 Mar 2020	Mitsubishi 80% / Chubu 20% — J-SOX internal-control obligations attach and flow down
18 Oct 2024	Belgian NIS2 law in force
FY2024	Eneco discloses that deficiencies were identified in its IT General Controls — assessed as not material, with multi-year remediation described as "an area of continued focus"
18 Apr 2026	Belgian Centre for Cybersecurity conformity checkpoint — passed
Apr 2027	Full ISO/IEC 27001 or CyFun® certification due — roughly eight months out
Ongoing	NIS2 incident reporting at 24 hours, 72 hours and one month; annual J-SOX testing of IT General Controls across the SAP and billing estate

The control framework is COSO ERM 2017. There is an operational-technology cyber risk-reduction programme, and cyberwarfare is named as a group risk. Certifications in evidence: ISO 27001 and IEC 62443. No published Eneco Belgium security incident, data breach or GDPR enforcement action was found; the two known group incidents (January 2021 credential stuffing, May 2024 AddComm) are Dutch.

On the EU AI Act. Article 50 transparency obligations have applied since 2 August 2026, and Elli is squarely in scope across chat, voice and outbound. Eneco's public terms do describe it as an AI assistant, which is the core of the obligation — Article 50 does not require citing the Act in terms of use. What is not visible from outside is the supporting evidence layer: disclosure wording per channel, the hand-over record, and how it would be demonstrated to a regulator. Separately, the Annex III high-risk deadlines were provisionally agreed to move to December 2027 under the Digital Omnibus — a political agreement of 6 May 2026, not adopted text.

Technical hiring signals

Of 21 open Eneco roles, ten are technology — and all ten are in Rotterdam. There are no Belgian IT vacancies. The technologies named map the direction of travel precisely:

ROLE	NAMED TECHNOLOGIES	SALARY
Virtual power plant / behind-the-meter	.NET/C#, Azure, Kafka, Terraform	€95–140k
Home energy management (HEMS)	TypeScript, Node.js, Azure Functions, IoT Hub, Event Hubs, API Management, Terraform	—
Machine learning	Databricks, MLflow, AWS, Scala on Spark, Docker, Kubernetes, drift detection	€84–117k
Data architecture	"Lakehouse-based design interoperating with Databricks and Snowflake", dbt, Airflow, and explicitly GenAI and LLMOps — retrieval-augmented generation, vector search, prompt orchestration; GitHub Actions, Azure DevOps, Terraform, Bicep	€93–150k
Governance	Collibra with Snowflake, Databricks and Kafka; data contracts and lineage	—
Operational technology	SCADA, PLC, IEC 60870-5-104, OPC-UA, Modbus, IEC 62443	—
Heat carve-out	Enterprise/Transition Architect — transitional service agreements and separation architecture	€120–180k

Four patterns follow. **Build in Rotterdam, buy in Belgium.** A deliberate **multi-cloud split** — Azure for enterprise and IoT, AWS for machine learning. A **Snowflake and Databricks consolidation** in flight, with governance tooling being stood up around it. And the highest-paid technology role advertised is a **separation architect for the heat business** — evidence of a structural carve-out in progress that has nothing to do with Belgium but consumes senior architecture capacity.

Synthesis

Executive summary

Eneco Belgium is Belgium's third-largest energy supplier, its largest single solar producer, the holder of the largest flexibility position in the country, and — on the evidence of the last eighteen months — the group's fastest market from idea to live product. It is also the market with the thinnest local technology capability, the widest fixed-price premium in Belgium, and a green positioning being re-based from Rotterdam.

Twelve findings.

1. **Third nationally, but a distant third — and absent from Brussels.** 12.63% of Belgian electricity customers and 13.91% of gas, behind ENGIE Electrabel (40.57% / 39.24%) and Luminus (24.15% / 23.79%). Roughly 10% in Flanders, behind TotalEnergies in Wallonia, and withdrawn from Brussels residential since September 2023.
2. **The offtake, not the equity, is the engine.** Eneco owns 12.5% of SeaMade but takes 100% of its 487 MW output — eight times more energy than equity. With 50% of Norther, the Belgian retail book is sourced almost entirely from two offshore assets whose support terms were fixed in 2017–18.
3. **And that model is being closed by tender design.** The revised Princess Elisabeth framework, approved 24 July 2026, removes the 50% PPA carve-out from the two-sided contract for difference.
4. **Its fixed tariff is the most expensive in the market.** At 3,500 kWh, Zon & Wind Vast prices at roughly €1,517–1,523 a year against Wase Wind at €1,321 — and sits 4.87 c€/kWh above Eneco's own variable product, the widest such premium of any large Belgian supplier.
5. **Household solar injection now nets out at close to zero.** 6.38 c€/kWh on a typical 2,000–2,500 kWh export yields €128–160 a year against an administrative charge of €124.63 per connection. Flemish installations fell 35% year on year in Q1 2026.
5. **Belgium built the group's flagship customer capability first.** Elli was built in three months and the Netherlands adopted it afterwards. It contains 67% of conversations without hand-off, up from 40%, at 24,000 chats a month, and Eneco's own annual report records it cutting call time by 90 seconds in Belgium against 60 in the Netherlands.
7. **Yet every technology vacancy is in Rotterdam.** Ten of 21 open roles are technology and all ten are Netherlands-based. Belgium has no local equivalent of the group's Platform Engineering, Data & AI or Cyber Security units — and its flagship device propositions run on partner software from Eniris, NET2GRID and Jedlix.
3. **The billing chain is the single largest source of customer pain.** Meters and billing together are 46.8% of all Federal Ombudsman cases. Eneco logged 1,386 complaints in 2024 — a halving in one year, yet still over-indexed against share. The Atrias/MIG6 defect has run five years with 919 meters still blocked in April 2025, and suppliers carry the unbilled receivable with no compensation scheme.
9. **Storage is where Eneco has taken Belgian market leadership — deliberately asset-light.** 400 MW / 1,540 MWh under control by 2027, of which only 50 MW is owned. The largest flexibility position in Belgium on a fraction of the balance sheet, which makes contract terms rather than engineering the determinant of what it earns.
9. **The wholesale market increasingly pays nothing when the wind blows.** 518–520 negative-price hours in 2025, 5.9% of the year, floor –€462.30/MWh, against 404 in 2024; roughly 11% of 2026 hours to date at or below zero. Eneco's Belgian book is almost entirely wind, with no dispatchable Belgian generation since 2023.
1. **Group returns recovered — then wobbled at the parent.** Revenue fell to €6,616m, but EBITDA reached its series high of €791m and ROACE recovered from 5.6% to 6.9%. However, Mitsubishi's Q1 FY2026 filing records Eneco swinging to a ¥0.8bn loss, a ¥1.4bn year-on-year deterioration.
2. **The strategy that carries the green promise is being rewritten, on a date inside the engagement window.** Eneco states "the energy transition is losing steam", with a revised One Planet Plan outline due autumn 2026. Greenpeace has moved Eneco Belgium 18/20 → 16/20 → 13/20, while its guarantee-of-origin book reads 94% wind, 4% nuclear, 2% gas against a tariff card promising 100% green.

Technical summary

The shape of the estate. A Microsoft-standard core — SAP on Azure, Dynamics 365 for CRM and service, Copilot Studio for conversation — over an irreducibly Belgian market-interface layer that has no equivalent anywhere else in Eneco: Atrias/MIG6 messaging across three separate distribution operators, with three consent regimes, three green-certificate regimes and three compensation scales. Data sits on a Databricks and Snowflake lakehouse with Collibra governance and a deliberate multi-cloud split that puts machine learning on AWS. Asset and flexibility control runs through a group VPP built in-house in .NET/C#, with no evidenced Belgian extension.

What is genuinely strong. Elli is a real production system that transacts rather than deflects, across four channels, multilingual, built in three months — and it was exported upward to a market five times the size. The eMobility deployment followed the same path. Belgium's demonstrated capability is speed of integration.

What is genuinely thin. No public API programme in any market, and a visible failed precedent — three API gateways in eight years and a Toon open-API effort that has been dormant since 2021. No meaningful open-source output since 2018. No engineering blog, tech radar or architecture decision records. One conference talk in three years, and no Belgian engineer speaking anywhere. No evidence of AI-assisted development. And the Belgian organisation describes itself custodially — "a stable and reliable digital environment" — where the group describes full-cycle product teams owning the journey from idea to deployment.

The three questions that matter most.

- 1. **Is MECOMS 365 live, and in what scope?** Ferranti is the sole source for the entire Belgian meter-to-cash claim, and its owner changed in May 2026.
- 2. **Is Belgium a tenant of the group's backend-for-frontend, or a separate estate?** The Dutch customer API path is country- and brand-parameterised; whether Belgium sits inside it determines whether platform alignment is even available as an option.
- 3. **What did the AI maturity scan conclude?** An internal answer beats any outside-in assessment.

The honest position. Eneco Belgium is ahead of its Belgian peers on conversational capability in production and behind the European reference set on the surrounding machinery — a published use-case portfolio, a centre of excellence, an AI governance certification, board-level digital ownership. Both halves are true, and the second is not a criticism of the first.

SWOT

STRENGTHS	WEAKNESSES
Third-largest supplier with 1m+ connection points and 55,000 business connections	Fixed tariff priced at the top of the market, 4.87 c€/kWh above its own variable
Largest flexibility position in Belgium — 400 MW under control by 2027	Only 50 MW of that storage is owned; the rest is contractual
100% of SeaMade's output on 12.5% equity — an exceptionally efficient sourcing structure	Sourcing concentrated on two offshore assets with terms fixed in 2017–18
Greenest of Belgium's large suppliers; 100% Belgian wind and solar claim	GO book reads 94% wind, 4% nuclear, 2% gas; external score fallen 18 → 13
Belgium built and exported the group's flagship customer capability — 67% containment, –90s call time	No Belgian technology vacancies; no local platform, data or security function
Belgium's largest single solar producer, 450,000+ panels, ESCO model with zero host capex	Device intelligence is partner software — Eniris, NET2GRID, Jedlix
Complaints halved in a year, from 2,761 to 1,386	Still over-indexed on complaints vs share; 1.4-star app, Dutch only
Named corporate anchors: INEOS, Google, Borealis, Aurubis, ArcelorMittal, Audi, Volvo	Absent from Brussels residential; no dynamic product or app in French
Group balance sheet A–, no covenants, hedged to 2028, ROACE back to 6.9%	~350 people carry a national book; eNPS 55 → 44
OPPORTUNITIES	THREATS
Digital-meter completion — Flanders 2029, Wallonia 80% by 2029 — unlocks the full addressable base for dynamic and flexibility products	Churn at 19–21% a year, with a mandatory comparison code on every invoice and ten new entrants in 2025
~1 GW of unmonetised household battery flexibility already behind Belgian meters	518–520 negative-price hours and capture-rate erosion on an all-wind book
The revised One Planet Plan outline, autumn 2026 — a live window to shape Belgium's mandate	The PPA carve-out removed from the next offshore tender, closing the sourcing model
Time-of-use network tariffs in 2029, which Eneco has publicly argued for	ENGIE nuclear takeover restructuring the largest competitor's economics
Flemish >1 GWh rooftop-solar obligation and Peppol e-invoicing as live B2B hooks	Grid queue — ~800 companies at Elia; Storm's 300 MW due 2027
The excise shift from electricity to gas favours electrification propositions	Ferranti change of control at the stated billing platform, mid-programme
Belgium as the group's proven fast-integration market — a repeatable claim	WAMCA price-clause litigation [NL], 275,000+ registrations, hearing Sept 2026
Corporate demand: Google's €5bn Belgian data-centre expansion and the 70 TWh request pipeline	Mitsubishi divestiture line and a ¥0.8bn Q1 FY2026 loss at the parent

Excluded by rule — company-data aggregators and profile-scraping sites (companyweb, trendstop, fincheck, staatsbladmonitor, Dun & Bradstreet, Crunchbase, PitchBook, TheOrg, RocketReach, ZoomInfo, Selectra, CallMePower). Where such a source was the only one available, the claim was dropped rather than downgraded.

Unreachable during research — the National Bank of Belgium's Balanscentrale (consult.cbso.nbb.be), several CREG endpoints, Trustpilot, Glassdoor, various VREG PDF and Power BI dashboards, the Eneco Annual Report 2025 (published only as a Publitas flipbook), and paywalled De Tijd and L'Echo articles. These account for most of the validation agenda.

Challenge Cards

How these were built, and how to use them

Four isolated agents each generated six candidates from a different lens — customer and revenue, energy and flexibility, technology and capacity, strategy and trust — and filtered to their strongest two. Collisions were re-angled into distinct facets rather than discarded. The surviving set was then gated against a five-part test: every card must be a **business outcome** rather than a functional task, span at least two parts of the business, sit at managing-director altitude, be ownable by any senior leader at a mixed table, and be grounded in evidenced pain while remaining scopeable as a one-session thin slice.

No card names a solution, a tool, a vendor, a technology or a job title. Those are invented in the room — a card that pre-empts them has failed.

Three cards anchor the session — one technology-rooted, two business.

Why these three lead

CARD	WHY IT LEADS
P1 Money and trust stuck between the meter and the bill	Technology-rooted. The heaviest evidence in the pack — 46.8% of all customer escalation — and the clearest one-session build. It also spans three functions with no natural owner today, which is exactly what a cross-functional table is for.
P2 Re-winning the whole book every five years	Business. The largest commercial number on the account, now sharpened by two new findings: the fixed tariff is priced at the top of the market, and Dutch litigation is testing the very clause structure Eneco's variable products use.
P3 Flexibility is scaling faster than the earnings from it	Business. The most forward-looking, and the one that decides what replaces commodity margin. Eneco has taken Belgium's largest flexibility position deliberately asset-light — so the earnings question is contractual, and settleable in a room.

CARD P1 · TECHNOLOGY-ROOTED

Money and trust stuck between the meter and the bill

The challenge

Eneco sells to more than a million connection points but cannot see, on its own, what most of them consumed. The reading arrives from someone else, late and sometimes not at all, and the invoice waits behind it. Nearly half of everything customers escalate is about that gap rather than about price, and some households have waited years for a bill they still owe. The company carries the anger, the cash cost and the disputed receivable for a failure it does not own and cannot fix alone.

Why it matters now

The defect entered its fifth year in 2025, with 919 meters still blocked in April 2025 and the grid operator fined roughly €500,000 by May. Suppliers carry the unbilled receivable and the late-payment interest, and no compensation scheme exists. Customer debt is worsening at the same time — Brussels consumer debt has reached €137 million at €258 per customer, nearly double Wallonia's €144 — so every week of billing delay lands on a customer less able to absorb it.

The evidence

- Meters 24.2% and billing 22.6% — 46.8% together — of all Federal Ombudsman cases, against prices at 19%.
- Settlement lands 6–8 weeks after Eneco receives grid-operator readings, and no deadline is published. Eneco's own FAQ carries "my meter readings are stuck" and "the readings on my settlement are wrong" as standing entries.
- The Atrias/MIG6 market-message defect is in its fifth year: roughly 3,000 Flemish, 7,500 Walloon and 500 Brussels access points blocked six months or more; Fluvius fined €120,190 plus €2,500 a day.
- Three separate regional data regimes — Fluvius, ORES/RESA, Sibelga — with opt-in consent friction and no Walloon equivalent to Fluvius. Belgian customer data access is a Fluvius consent flow with a two-to-three-day activation, not an Eneco interface.
- Flanders had 85,000 households on the social supplier in 2025, with 17,039 gas self-disconnections, up 9.2%.
- Eneco's complaints halved from 2,761 to 1,386 in a year — so the operational trajectory is good, and the residual is structural.

What this spans

Customer and commercial own the complaint, the churn and the debt. Operations and support carry the assisted-channel cost, the dunning and the collections. Market and regulatory sets three compensation regimes and the Ombudsman exposure. The trigger event sits entirely outside the company — so the answer is about how Eneco behaves during the wait, which is a commercial and service decision, not a repair job.

Constraints the room must respect

- Three regional regimes, not one. Collections already encode €20–€2,000 compensation in Flanders and Brussels against €55 a year capped in Wallonia, with different formal-demand fees.
- The upstream defect belongs to a third party and has not been fixed in five years. Assume it persists.

- What runs underneath the Belgian meter-to-cash chain is stated only by a vendor, and that vendor changed owner in May 2026. State the assumption rather than inherit one.
- Around 350 people carry the whole Belgian book.

Why this is a good build

A single session can produce the thing that does not exist today: an agreed account of what a customer should experience during the weeks when nobody knows what they used, and who owes whom what at each point. Everything downstream — the reminder, the advance, the complaint, the save — depends on that decision, and the room can actually make it in a day.

CARD P2 · BUSINESS

Re-winning the whole book every five years

The challenge

One in five Flemish customers changes supplier each year, and the business segment churns hardest of all. The invoice that is meant to carry the relationship now also carries a legally mandated code telling the customer whether to leave. Ten new suppliers entered in a single year, and the market's three-year satisfaction winner exited household supply altogether in July 2026. And Eneco's own fixed tariff — the product most exposed to that comparison — is priced at the top of the market. The question is what the company sells, and what it is trusted on, when the entire book must be won again roughly every five years.

Why it matters now

Since 1 July 2025 the exit prompt has been compulsory on every bill and renewal letter, and the regulator links the 2025 step-up in switching directly to it. Top-three Flemish share has fallen from 77.7% to 74.0% since 2022 while smaller suppliers took 5.4 points of volume. From November 2026 the comparison tool assesses variable contracts on full quarter-hourly price history. The erosion is live, not forecast.

The evidence

- Flemish electricity switching 19.35% in 2025 — households 18.94% on 562,481 switches, business 21.09% on 148,762.
- Eneco's fixed product sits 4.87 c€/kWh above its own variable — roughly €1,517–1,523 a year at 3,500 kWh against €1,321 for the cheapest supplier.
- Decomposing the published formula, the residential variable adder is 3.058 c€/kWh against 2.581 for business and 1.000 for dynamic — the margin structure differs by a factor of three across products the same customer can choose between.
- Ten new suppliers entered Flanders in 2025; DATS 24, three years the Test-Aankoop winner, exited household supply to EnergyVision on 30 July 2026.
- Only ~45% of a Walloon electricity bill is commodity; 55% is network, levies and surcharges Eneco bills but does not set — and the excise shift runs in fixed steps to January 2029, reaching +€35.30 a year for a dual-fuel household.
- Eneco publicly opposes group-purchase campaigns and runs no referral programme, in a market where those campaigns are a named driver of switching.
- [NL, but directly relevant] A Dutch mass claim with 275,000+ registrations is testing variable-tariff price-change clauses, with a hearing in September 2026 and a Supreme Court ruling due in December. Eneco's Belgian variable products use exactly this kind of indexed clause.

What this spans

Customer and commercial own the offer, the price and the save. Market and regulatory set the comparison verdict, the levy timetable and the pricing granularity. Operations and support determine whether a save is credible when it is made — a customer who has just had a billing failure does not accept a retention offer. A pricing answer alone loses to an execution failure; an execution answer alone still ends with a code on the bill saying check elsewhere.

Constraints the room must respect

- The comparison code on the invoice is a legal duty, not a design choice.
- Over half the bill sits outside Eneco's control, and the excise shift lands on government-set dates.
- Day-ahead pricing went quarter-hourly on 1 October 2025; full quarter-hourly history enters the comparison tool in November 2026. Anything that cannot represent at that granularity will be misranked on the tool consumers actually use.
- Eneco does not publish churn, retention or acquisition-cost figures — the room will need to supply them.

Why this is a good build

Belgium already knows which conversations trigger churn and which invoices go wrong. A session can produce a worked, evidenced picture of one high-churn cohort end to end — what they were told, what arrived, when, and what it cost to hold them — which nobody currently owns across all three functions.

CARD P3 · BUSINESS

Flexibility is scaling faster than the earnings from it

The challenge

Eneco Belgium is accumulating flexible capability on both sides of the meter at a pace its ability to convert that capability into margin has not matched. On the asset side, an almost entirely wind-based book meets a market that increasingly pays nothing — or pays negatively — exactly when the wind blows. On the customer side, roughly a gigawatt of household

flexibility already sits behind Belgian meters and is essentially unremunerated. And most of the fleet Eneco will manage in 2027 belongs to somebody else, which makes the question of who captures the value a commercial one, not an engineering one.

Why it matters now

Belgium recorded 518–520 negative-price hours in 2025 — 5.9% of the year, a record — and roughly 11% of 2026 hours to date have cleared at or below zero. The single largest addition to the managed fleet, 300 MW and 1,200 MWh, delivers in 2027 on a ten-year contract. The earnings model has to be settled before the volume arrives.

The evidence

- 518–520 negative-price hours in 2025, floor –€462.30/MWh on 11 May, against 404 hours in 2024. Wind and solar reached 22.23 TWh, 37% of output.
- 400 MW / 1,540 MWh of storage under control by 2027 — of which Eneco owns 50 MW. D-STOR belongs to BSTOR and Duferco; Storm's 300 MW belongs to Storm. A third of the headline rests on one developer, one hardware supplier and one delivery year.
- Around 150,000 Flemish home batteries hold roughly 1 GW of unused flexibility, yet only 0.3% of Flemish households hold a dynamic contract — and just 58 dynamic contracts exist in the whole Brussels region.
- Household injection now nets to roughly zero after the €124.63 annual administration charge, and Eneco already charges business injectors to inject during negative hours.
- Both offshore assets sit under mechanisms fixed in 2017–18, and Eneco takes 100% of SeaMade's output on 12.5% equity — the sourcing structure the whole Belgian book depends on.
- No dispatchable Belgian generation since the 870 MW Manage project was withdrawn in September 2023.
- The device-level steering in Eneco's own Belgian propositions is partner software, and the group's flexibility platform has no evidenced Belgian extension.

What this spans

Assets and flexibility hold the fleet and the dispatch decision. Customer and commercial own the contracts and tariffs through which flexibility is actually sold. Market and regulatory set granularity, network tariffs and meter access. Operations and support carry the settlement that makes any reward provable. An asset optimised perfectly still earns nothing if no customer contract exists to share the value, and no customer reward is payable if settlement cannot evidence it.

Constraints the room must respect

- Only 50 MW of Belgian storage is owned; the rest is contracted, and the terms are what determine the margin. The ">1.2 GW across 15 projects" figure is a 2027 group target across the Netherlands, Belgium and Germany, not a present Belgian capability.
- The dynamic product is Flanders-only and digital-meter-gated; time-of-use network tariffs are deferred to 2029.
- Capacity payments are set by auction — €14,100/MW/year for 2026–27 rising to €27,300 for 2029–30 — not negotiable.
- Grid connection is the binding constraint: roughly 800 companies in Elia's queue at April 2026, with both Storm sites due in 2027.

Why this is a good build

One session can produce a defensible, numbers-first view of what a single contracted asset and a single household segment would actually have earned against 2025's real price shape, and what would have to be true — commercially and contractually — to retain more of it. That is a decision object a managing director can take into a capital conversation, not a demonstration.

Appendix

Validation agenda

A small number of items could not be resolved from the public record. They are collected here rather than qualified throughout the report.

ITEM	POSITION
Belgian entity financials	The National Bank's Balanscentrale was unreachable throughout research. No Belgian revenue, result, equity or FTE figure is asserted anywhere in this report. Aggregator renderings were excluded by rule. The illustrative margin arithmetic in the business-model section is derived from published tariff formulas, not from company accounts.
Norther shareholding	Eneco's own sites and norther.be state Eneco 50% / Elicio 50%. Elicio's 2016 financial-close release and European Commission case M.8271 describe Elicio 50% / Eneco 25% / Diamond Generating Europe 25%. Both non-Elicio halves are Mitsubishi-affiliated, so the economic exposure is identical; the legal split is not. No post-2016 cap table is published.
MECOMS 365 scope and status	Ferranti is the sole source for the entire Belgian meter-to-cash claim. No Eneco publication, report or job advertisement names it. Its owner changed on 28 May 2026. The first technology question to ask.
Is Belgium a tenant of the group's customer backend?	The Dutch API path is country- and brand-parameterised; the Belgian portal advertises its own OIDC client. Not determinable from outside, and it decides whether platform alignment is available at all.
Current Belgian solar MWp	Last published aggregate is 100 MWp (March 2021); since then only panel and site counts.
Onshore turbine manufacturers	Eneco publishes ratings and rotor diameters for every Belgian park but names no onshore turbine manufacturer anywhere.
Eneco eMobility Belgian charge points and legal status	Only the European roaming-network figure is published, which is other operators' hardware. Belgian incorporation status unconfirmed.
Princess Elisabeth consortium shareholding	Never disclosed — reasonable, given the tender has not run. Whether the consortium bids into the relaunched Lot I is also unstated.
2025 Ombudsman supplier data	Not published at the time of research; 2024 is the latest supplier-level view.
Walloon and Brussels percentage share tables	CWaPE and BRUGEL publish through interactive dashboards only, and several CREG endpoints returned errors. Regional shares are CREG-derived approximations.
Contract mix	The fixed / variable / dynamic split of Eneco's Belgian book is not published.
Elli's current operating metrics	The containment, volume and intent figures are Microsoft's, published May 2025. Which channels are in full production versus limited rollout is unstated.
The AI maturity scan	Reportedly completed enterprise-wide; its conclusions are not public.
Eneco's Atrias/MIG6 exposure	The defect and the regulator's penalties on Fluvius are well evidenced. No Eneco-specific loss figure exists, and no supplier compensation scheme was found.
Storm and D-STOR contract terms	Structure is documented; availability guarantees, liquidated damages and revenue-share terms are not.
The "energie-intelligentie" quotation	Widely repeated and attributed to Bert Clinckers, but not located on a primary source. Not used in this report.
Review-site sentiment	Glassdoor and Trustpilot were unreachable. No employee or customer review sentiment is reported rather than invented.

Two corrections carried from the cross-check against the TCS pursuit report

First, the conversational-assistant statistic: Microsoft publishes both "70% more conversations handled" (capacity) and "67% resolved without hand-off, up from 40%" (containment). These are different measures, and the containment figure is 67%.

Second, the group customer-satisfaction rise of 84.3% → 85.5% → 86.2% is a group figure across all countries and segments, and Eneco attributed only the first step partly to AI-driven efficiency, attributing the second to telephone and digital channel improvements. Separately: Vincent Tuk is Chief Digital Officer, not CTO, and is not a Management Board member; Eneco entered Belgium in 2004, not 2003; and there is no Eneco office in Brussels.

Two claims flagged as doubtful were checked and found correct, and are adopted here: Martijn Hagens was Senior Vice-President and Head of Business Area Markets at Vattenfall and CEO of its Dutch organisation, and did begin his career at Accenture.
